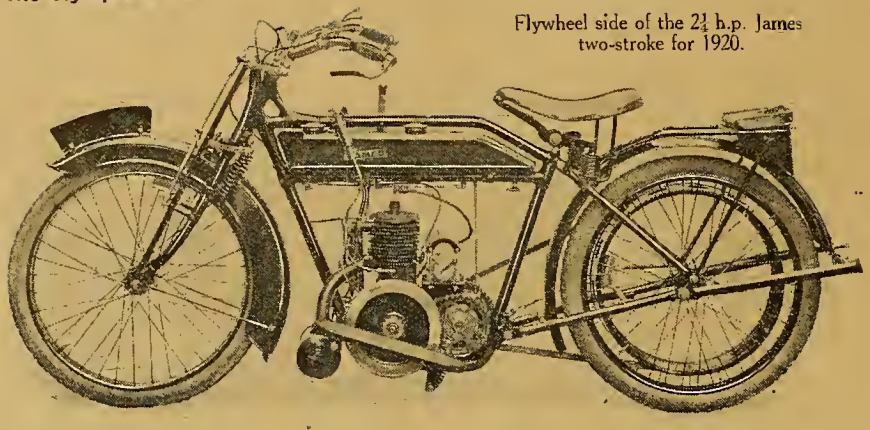
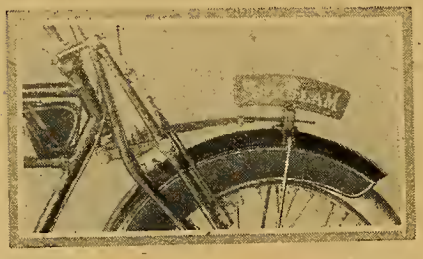
is provided for chain tension. Druid type spring forks are used. Attached to these machines is a fine example of James *de luxe* sidecar, finished in brown to match the tank, and attached to the cycle at four points. This sidecar is fitted with an extremely neat and ingenious windscreen. The main screen is of glass, having hinged celluloid side screens. The whole screen automatically folds away as the sidecar door is opened, so as to admit of an easy entry. Once inside, the passenger can, if desired, utilise a fabric cover for protection. This cover may be rolled up to the little dashboard, or, if no passenger is carried, can be used to cover the seating accommodation. A similar experimental model

The Olympia Show.—



Flywheel side of the 2¼ h.p. James two-stroke for 1920.

is shown on the stand, the chief alteration being a somewhat larger engine of 750 c.c., having enclosed valve springs, a larger brake, and a very neatly enclosed kick-starter. This last-mentioned feature is standard on all James models. It must be clearly understood that this model is purely experimental, and that no manufacturing programme has been laid out, so that enquiries from the public at the present time will be useless. The larger type of machine is also fitted with Brampton duplex forks.



A laminated leaf spring is used in the fork of the 1920 3½ h.p. Sunbeam.

4¼ h.p. single-cylinder four-stroke MODEL: 86×103 mm. (600 c.c.); side-by-side valves; Amac carburetter, Thomson-Bennett gear-driven magneto; three-speed gear; chain drive; 28×3in. tyres.

The 4¼ h.p. James has given satisfactory service for some years past, and its performance with a sidecar in the recent Six Days Trials was extremely creditable. The transmission of the James big single is similar to that already described on the 5-6 h.p. model. The James big single is primarily designed for sidecar service, and the frame incorporates all the necessary lugs for sidecar attachment. A decompressor is included in the timing gear to facilitate starting, and throughout the machine is solidly and sensibly constructed. One feature which James riders will miss is the use of Timken roller bearings in the wheels. These bearings are necessarily omitted owing to the impossibility of obtaining delivery, but a very satisfactory ball bearing has been evolved, in which unusually large balls are used, and this type has shown itself an excellent substitute in every way.

3½ h.p. V twin four-stroke MODEL: 64×77 mm. (500 c.c.); side-by-side valves; Amac carburetter; Thomson-Bennett chain-driven magneto; three-speed gear; chain drive; 26×2¼in. Palmer tyres.

Primarily designed for solo work, the 3½ h.p. twin James is an extremely handy little mount. Its performance in the T.T. as regards speed will be remembered by keen motor cyclists. It is a smaller replica of the 5-6 h.p. already described, though perhaps it would be more correct if it were called a prototype. This machine is one of the few motor cycles in the Show which are purely designed for high speed solo work, the makers having no intention of it being used for sidecar purposes. It is an extremely fine example of its type, and will be of considerable interest to the sporting type of rider. In the case of the 3½ h.p. a multi-plate clutch is controlled from the handle-bar.

2¼ h.p. single-cylinder two-stroke MODEL: 64×70 mm. (226 c.c.); Amac carburetter; Thomson-Bennett chain-driven magneto; two-speed gear; chain-cum-belt drive; 26×2½in. Dunlop tyres.

The two-stroke James is another model which performed very creditably in the Six Days Trials. The engine is the usual three-port type, but the gear is somewhat unusual, in that there are two chains from the engine, which are connected as desired to the main camshaft by dog clutches, whence a belt drive transmits the power to the rear wheel. Both the engine aud gear are mounted within a simple loop frame.

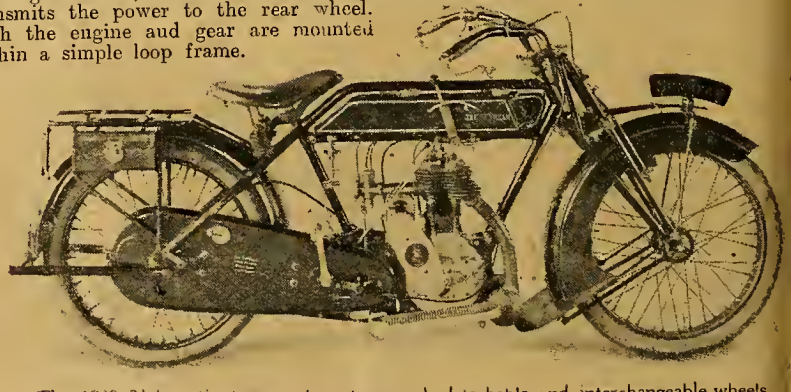
SUNBEAM, No. 49.

3½ h.p. single four-stroke MODEL 85×88 mm. (499 c.c.); side-by-sid valves; B. and B. carburetter E.I.C magneto, chain at rear three-speed countershaft gear chain drive in oil bath; 650×6 mm. tyres.

JOHN MARSTON, LTD., Wolverhampton —There would be much heartburning i by any chance Messrs. John Marston Ltd., elected to abandon the manu facture of the popular 3½ h.p. Sun beam. For some time it has bee the Rolls-Royce of solo motor cycles i the opinion of a large coterie of single track enthusiasts, and the rumour curren for some time that the well-known singl would be replaced by a similar machin of larger capacity was not received wit acclamations, as it was considered tha to enlarge the capacity would be to mak it more suitable for sidecar use than fc solo riding. The most drastic alteratio is the adoption of a new type of sprin fork, which embodies a laminated le

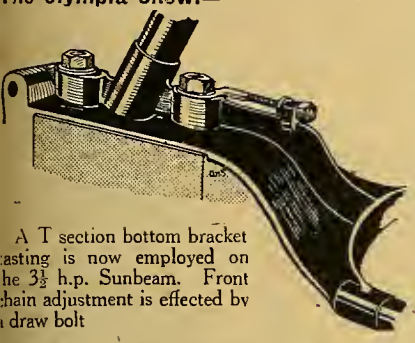
The seat lug of the 3½ h.p. Sunbeam frame has the rear stays brazed in. An expander-bolt and cone secures the saddle-pillar, and a special lug is provided for the sidecar attachment.

spring in a very neat manner. The sprir approximately is 12in. long, and tl inner end is secured by four bolts and cross plate to a platform, which forms tl bottom pair of links of the fork. Tl outer end of the spring slides betwe two rollers carried in a bracket fixed the forward extension of the guard, an



The 1920 3½ h.p. Sunbeam, which has quick detachable and interchangeable wheels and a new type of laminated spring fork.

The Olympia Show.—



A T section bottom bracket casting is now employed on the 3½ h.p. Sunbeam. Front chain adjustment is effected by a draw bolt

incidentally, also supports the front number plate. Other improvements are connected chiefly with details not immediately apparent. The wheels are now detachable and interchangeable, and sidecar lugs are integral with the frame. The wheels are 650×65 mm., and improved mudguards are fitted, both front and rear being exceptionally wide. Improved stand clips, screw adjustment for the gear box, and a new pattern cylinder casting are also alterations from the 1919 machine. As in previous models, the well-known Sunbeam oil bath cases are used for the transmission. The sidecar chassis for this model is a new design of the Sunbeam Co., and is of the underslung type, having the wheel axle supported at both sides. On the inside the wheel spindle is secured by an upright member from the longitudinal tube of the chassis, but on the outer side two tubes from the front and rear of the wheel are inclined, and meet at the wheel spindle. The sidecar body is low, but roomy both as to length and width. It is of metal construction and well upholstered. The guard of 7in. section is secured to the body. The finish is made to match the black and gold Sunbeam motor cycle.

8 h.p. four-stroke MODEL : 85.5×85 mm. (976 c.c.); side-by-side valves; Amac carburetter; Magdyno; three-speed countershaft gear; chain drive; 28×3in. Dunlop tyres.

For 1920 the 8 h.p. Sunbeam very closely follows the lines of the 1919 model, which in truth would be very difficult to improve. Engined with an 8 h.p. J.A.P. power unit, fitted with a Sunbeam three-speed gear box, and having its chain drive enclosed in oil bath cases, this machine is a leading example of V twin motor cycles. The black and gold finish which has characterised Sunbeam productions since their inception (and, incidentally, is being copied) is retained, as are the leg shields, rubber-faced aluminium footboards, and Brampton type forks.

On one of the models exhibited the Lucas Magdyno is fitted, together with Bowey speedometer and the new horn of the same accessory firm.

NORTON, No. 115.

3½ h.p. single four-stroke MODEL : 79×100 mm. (490 c.c.); side-by-side valves; B. and B. carburetter; C.A.V. chain-driven magneto; belt; Dunlop 26×2¼in. tyres.

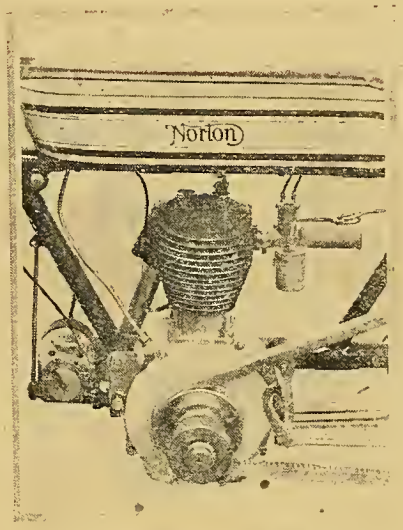
NORTON MOTORS, LTD., Phillips Street, Bolton, Birmingham. — Both Norton machines (there are really three of the 3½ h.p. belt and chain-driven types, and viewed as distinct) are designed to be capable of use with sidecars, but this model with a single-speed belt drive is obviously intended for solo work. For passenger use all-chain drive is recommended, but the belt-driven machine can, if required, be fitted with a Philipson pulley or a Bradbury gear. Full T.T. bars are standard. This machine is generally known as the 3½ h.p. speed Norton, and in one form is equipped as a track machine, every individual model of which has been certified to exceed 75 m.p.h. Druid forks are used, and a pedal-operated rear brake with the pad operating within the V of the belt rim.

3½ h.p. single four-stroke MODEL : 79×100 mm. (490 c.c.); side-by-side valves; B. and B. carburetter; C.A.V. chain-driven magneto; all-chain drive; Sturmey-Archer gear box; three speeds; Dunlop 650×65 mm tyres.

This model is fitted with the same frame as that used for the Big Four Norton, and provides a 6in. ground clearance for the crank case. T.T. bars are standard, and also a tank holding two gallons of petrol and three pints of oil. As with the speed models, a straight-through exhaust pipe is fitted with a capped and drilled extension piece. The rear brake on all Nortons is now adjusted by rotating a left and right-hand threaded coupling rod, which is of hexagonal section. The front chain adjustment is provided with a draw-bolt that applies to the anchoring studs of the gear box, this draw-bolt being neatly arranged below the bracket with the head accessibly placed at the rear end. Similarly neat and precise adjustment is provided for the magneto chain. On this model, and on the Big Four, the brake pad applies to a special rim on the rear wheel. The frame lugs are exceptionally long, that from the head in which the down tube is telescoped, for example, being a full six inches in length.

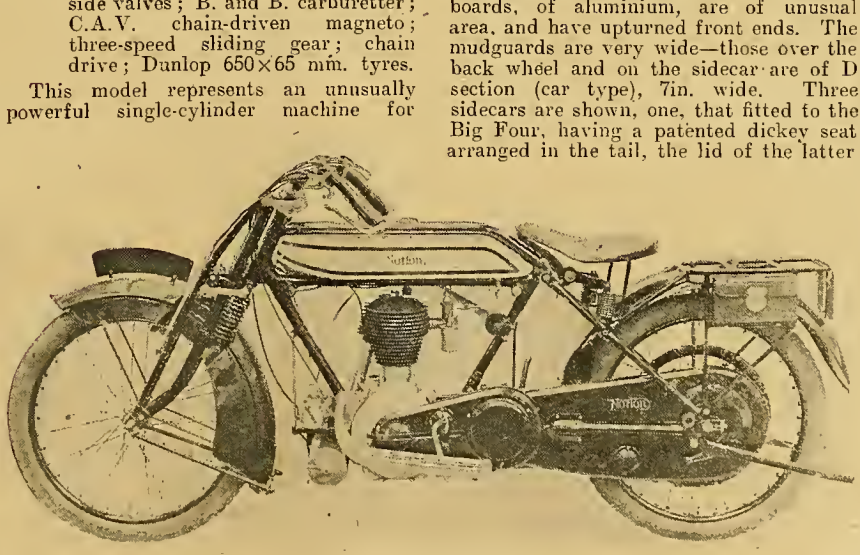
4 h.p. single four-stroke MODEL : 82×120 mm. (633 c.c.); side-by-side valves; B. and B. carburetter; C.A.V. chain-driven magneto; three-speed sliding gear; chain drive; Dunlop 650×65 mm. tyres.

This model represents an unusually powerful single-cylinder machine for



3½ h.p. T.T. Norton power unit of 79 × 100 mm. It has a Philipson governor pulley

sidecar work, for, although it is termed 4 h.p., it develops over 11 h.p. at 2,000 r.p.m. The frame has integral lugs with taper holes for sidecar attachments at four points; a noteworthy and commendable feature of the tube arrangements is shown in the triangulated front members, which provide an unusually stiff connection and give evidence of careful consideration of the stresses imposed. The standard type of stand for all models has three positions, *i.e.*, dropped for supporting the machine as usual out of use, and a middle state, where it is merely pushed on to the ground behind the wheel and is able then to support a solo machine by the presence of a powerful spring that holds the stand normally in or out of use. The chain drive on this model is completely enclosed, but the rear portion has a large and easily removable end that allows the wheel to be detached in a few minutes. The footboards, of aluminium, are of unusual area, and have upturned front ends. The mudguards are very wide—those over the back wheel and on the sidecar are of D section (car type), 7in. wide. Three sidecars are shown, one, that fitted to the Big Four, having a patented dickey seat arranged in the tail, the lid of the latter

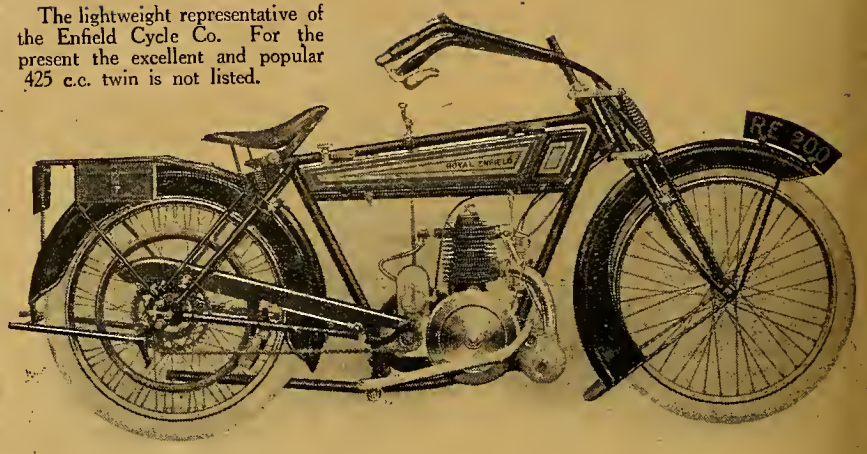


4 h.p. three-speed Norton with enclosed chain transmission

The Olympia Show.—

forming the back-rest of a seat capable of accommodating a child up to ten or twelve years of age. When not in use as a seat the cushion drops down and the compartment forms a large space for luggage, petrol tin, etc. All sidecar mudguards are fitted to the body, and are, therefore, sprung. The sporting sidecar attached to a 3½ h.p. chain model somewhat belies its title by affording a degree of comfort and luggage space unusual on sports models. But the weight is low, nevertheless, and the reduction of wind resistance has been carefully considered. The *de luxe* sidecar cannot fail to attract attention and favourable comment, if only by reason of its hinged back, which allows a suit case to be carried with room to spare for a petrol tin, while a long space running the full length under the floor of the body will hold golf clubs, fishing rods, or a gun case.

The lightweight representative of the Enfield Cycle Co. For the present the excellent and popular 425 c.c. twin is not listed.



ENFIELD, No. 72.

6 h.p. V twin four-stroke MODEL: J.A.P.; 76×85 mm. (770 c.c.); side-by-side valves; Amac (one-lever) carburetter; Thomson-Bennett chain-driven magneto; two-speed expanding clutch gear; chain drive; Palmer Cord 700×80 mm. tyres.

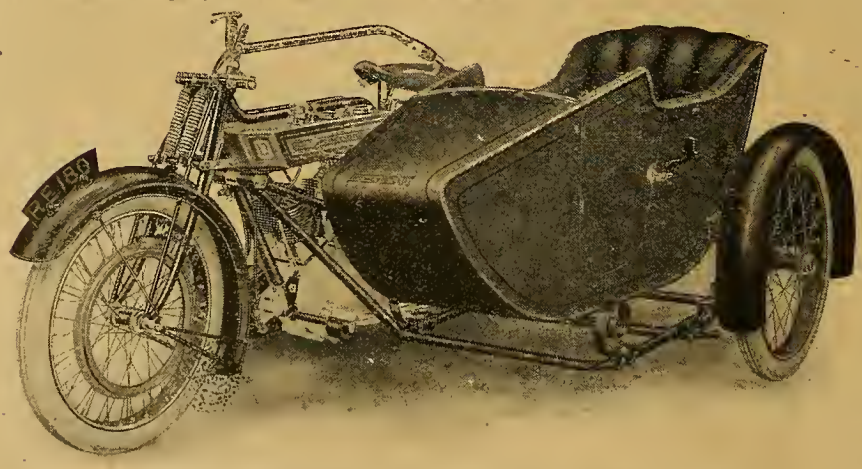
ENFIELD CYCLE CO., LTD., Redditch.—Not only in this country, but also in the Colonies, has the Enfield made for itself an enviable reputation. The company are specialising on two models—the 6 h.p. and the 2¼ h.p. The well-known 6 h.p. J.A.P. forms the power unit of the former, and the transmission is by the Enfield Co.'s own selective clutch gear, there being two chains from the engine to the countershaft with sprockets giving unequal ratios. Either of the sprockets may be clutched to the countershaft, driving the rear chain at will. In the hub lies a cush shock absorber. Quickly detachable wheels are used throughout the Enfield sidecar combination, and both front and rear wheels are fitted with dummy belt rims in which act internal V brake shoes. The tank holds a full two gallons of petrol and one and a half quarts of oil—a desirable feature in powerful sidecar machines. The Enfield Company was one of the first to adopt really wide mudguards extending well outside the forks and frame tubes. It has also clung throughout to handle starting. One of

A mud shield is fitted to the forward end of the Enfield footboards

the earliest firms to adopt special provision for dynamo lighting was the Enfield, and its 6 h.p. model is a very excellent example of a powerful sidecar mount, which has proved itself extremely popular throughout the world. As the sidecar is constructed specially for the motor cycle, one never sees the two main portions of the combination leaning inwards—a sight which is only too common on our roads. Lubrication is by sight feed drip.

2¼ h.p. single two-stroke MODEL 64×70 mm. (225 c.c.); Amac (one lever) carburetter; Thomson Bennett magneto, chain driven two-speed expanding clutch gear chain drive; Palmer Cord 24×2in tyres.

In contradistinction to the 6 h.p Enfield, the little 2¼ h.p. model is purely solo mount. It is of the three port two-stroke type, combining a light sloping top tube frame and good mud guarding, with the usual Enfield chain transmission and selective clutch two speed gear. A large aluminium silence is fitted in front of the engine, and the aluminium footboards are provided with small but effective leg shields. The miniature Enfield spring fork provide comfortable riding, so far as the front wheel is concerned. Many riders will miss the well-known 3 h.p. solo machine from the Olympia exhibit. The little machine, with its overhead inlet valves and mechanical lubrication, has long been an outstanding feature in the firm's productions. The Enfield company wisely avoid plated fittings in all their models where such can be avoided and their black finished workmanlike productions are most effective.



The 6 h.p. Royal Enfield and sidecar, a justly popular outfit noted alike for simplicity of construction and reliability in running.

RALEIGH, No. 64.

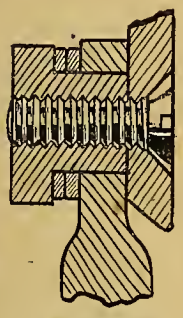
5·6 h.p. flat twin four-stroke MODEL 77×75 mm. (698 c.c.); side-by-side valves; Amac carburetter (one two-lever); gear-driven magneto spring frame; three-speed sliding gears built into countershaft; chain drive; Dunlop 650×65 mm. tyres.

RALEIGH CYCLE CO., LTD., Lenton Nottingham.—For the first time for many years the Raleigh Co. offer a motor cycle at Olympia. It is only to be expected that when this well-known cycle firm entered the motor cycle industry production would be of the highest order. The flat twin Raleigh is certainly one of the nicest designs in the Show, and,

The Olympia Show.—

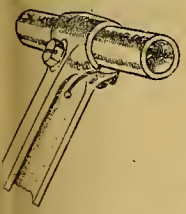
ike many opposed twins of the larger ize, the design is such that there are no gly gaps in the assembly. This result as been secured by a duplex frame, the ront cylinder being snugly disposed of n the triangle formed by the two front nbes, while immediately behind the rear ylinder the vertical duplex members of he frame are attached to a large casing vhich forms the main part of the gear ox. As the latter takes up very little oom, and the frame elements are imme- iately above it, no space is lost between he rear cylinder head and the mudguard f the back wheel; consequently a 5 .p. flat twin is obtained with a wheel- ase less than in many single-cylinder

The shock absorber on the 5-6 h.p. Raleigh flat twin engine-shaft sprocket.

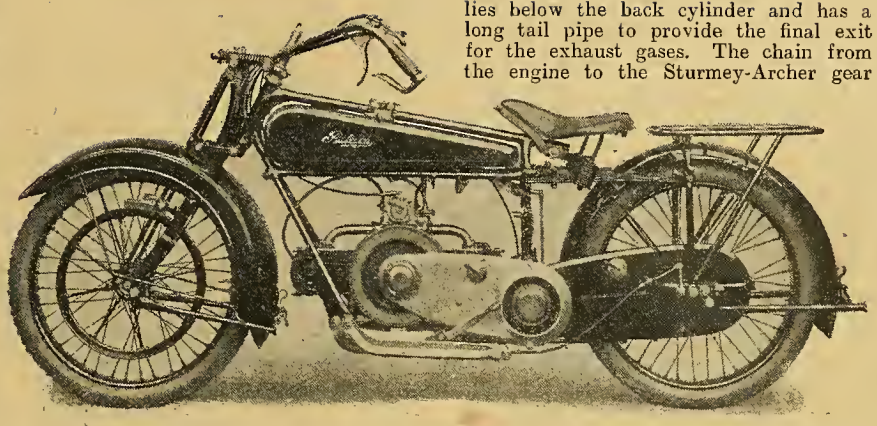


Rear stand bearing on the Raleigh flat twin; a spring washer prevents rattle.

achines of the conventional type. There re several specially striking features bout the engine, among which may be ientioned the large aluminium silencer. his is placed directly under the power nit, and extends for practically its entire ength, two very short exhaust pipes lead- ng into it. The method of supporting he engine in the frame, too, is interest- ng; it is carried on the horizontal members by means of two special clips and bolts. The Raleigh is also fitted with a spring frame, embodying two quarter-elliptic springs, carried from below the saddle to a loop which is pivoted on the back fork near the wheel centre. Those who have been troubled with rattling tool oxes and damaged tools through their rriage in pannier bags on the carrier their machine will note with pleasure e position of the Raleigh tool case ider the horizontal members of the ame. By placing the toolbag in this sition the contents are insulated from ad shock. The equipment in every way good, and includes wide guards and minium framed footboards with rubber- vered centres. The black finish with l and gold lines gives the machine a tinguished appearance.



The gudgeon-pins on the Raleigh flat twin are clamped into the connecting rod small ends.



The 6 h.p. Raleigh, a flat twin that will appeal to all because of its distinctive appearance quite apart from its praiseworthy mechanical features.

lies below the back cylinder and has a long tail pipe to provide the final exit for the exhaust gases. The chain from the engine to the Sturmey-Archer gear box lies outside the flywheel, and is covered by a cast aluminium case, the final chain being protected over the top run only. Brampton forks provide the front springing, and the magneto, which lies above the camshaft, is particularly accessible. Lubrication is effected by a simple hand pump, the oil being forced to a trough with overflows to each big end bearing; thence the oil passes to the crank case and oil well.

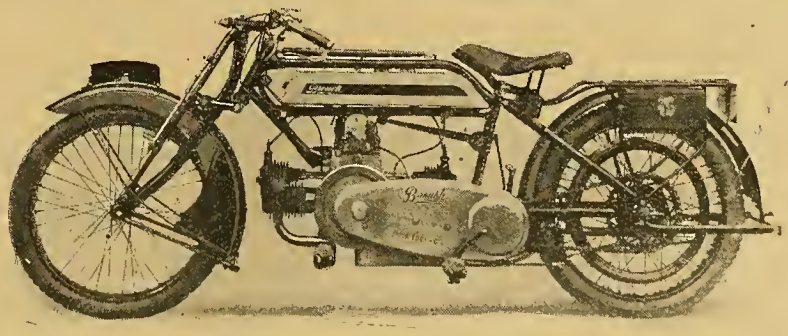
BROUGH, No. 69.

5 h.p. flat twin four-stroke MODEL: 70×90 mm. (690 c.c.); side-by-side valves; Amac carburetter; Lucas Magdyno, gear driven; Sturmey-Archer three-speed sliding gear; chain drive; Dunlop 650×65 mm. tyres.

W. E. BROUGH AND CO., Basford, Nottingham.—It is an undoubted fact that Messrs. Brough and Co., besides turning out a fast machine, have always succeeded in making their productions extremely taking to the eye. The latest model 5 h.p. Brough is no exception to this rule. In main features there are but few alterations since it was last described, but the cylinders are now cast with circular radiator fins. These fins have a series of grooves cut longitudinally at intervals so as to permit a current of air to reach all the required spots. The valves are disposed above the cylinders, and are closed by rather short but powerful springs, and the adjustable tappets are easy of access. One of the most striking features of the engine is its cleanliness, even after long use. This is largely accounted for by the fact that the crank case is made in one casting closed by a single cover plate which also forms the central portion of the induction pipe to which the carburetter is attached, thus the incoming mixture is warmed by contact with the engine. Two short stub pipes connect the cylinders to the carburetter. The two-part aluminium silencer

Plain bearings are used throughout the crankshaft, the main shaft bearings being fed from a point close to the outer end, and oil is screwed back by means of a special threaded bearing. The internal construction of the engine is most interesting. Messrs. Brough have determined that offset connecting rods are undesirable, and in consequence have preferred to offset the cylinders. An aluminium piston and hollow gudgeon pin are used and a special system of scraper rings to ensure equal lubrication to each cylinder. The workmanship of the internal parts is extremely fine, and all vital parts are ground to fine limits. Externally also the workmanship is good, and blind-ended nuts are used throughout the engine. It may be mentioned that it is possible to remove either cylinder without dismantling the engine, but as it is an extremely simple process to remove the whole power unit it is preferable to do this in the case of an overhaul.

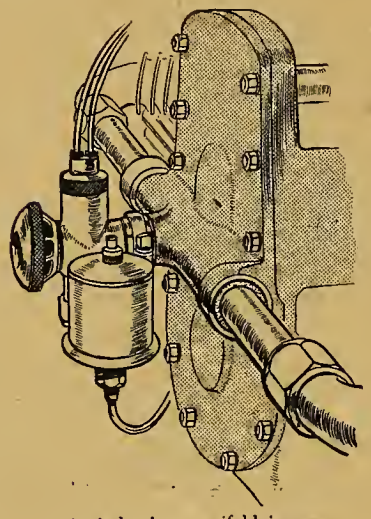
The new Brough is a fine example of a machine designed by a practical rider



The new 5 h.p. Brough flat twin, a model suitable for either solo or sidecar work

The Olympia Show.—

who willingly admits the enormous amount of knowledge of internal combustion engines that he has gained during the war, and embodied in his latest machine. The sidecar, which is specially built to suit the machine, has a very simple and strongly constructed frame, and a roomy well upholstered body is attached to the motor cycle at four points, and in addition to the leaf springing for the body the wheel is suspended on another leaf spring in a particularly ingenious manner. A large locker is formed in the back of the body.

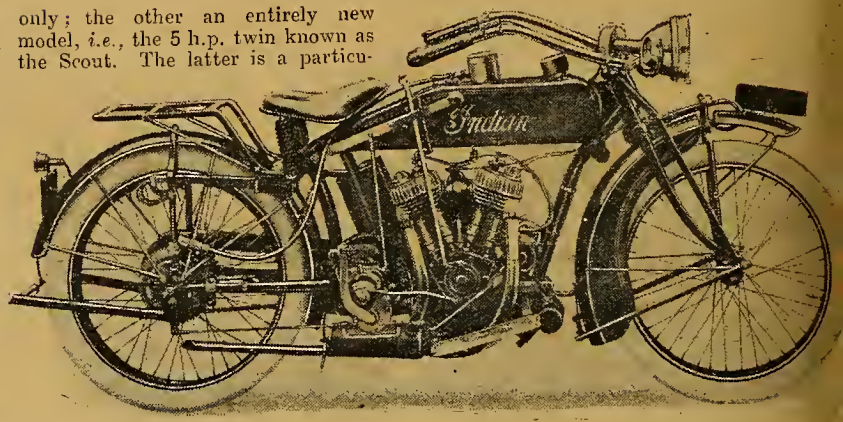


An induction manifold is cast in the timing gear cover of the 5 h.p. Brough.

INDIAN, No. 93.

5 h.p. V twin four-stroke MODEL: 70×78 mm. (596 c.c.); side-by-side valves; Schebler carburetter; gear-driven magneto; three-speed gear; transmission by spiral gears and chain; 26×2½in. tyres.

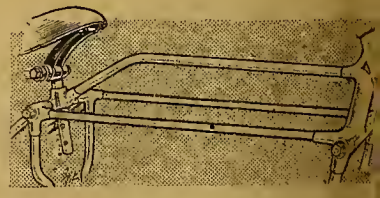
HENDEE MANUFACTURING CO., LTD., 366-368, Euston Road, N.W.1.—The Indian exhibit consists of two models—one the much appreciated 7-9 h.p. Powerplus, which is altered in detail only; the other an entirely new model, *i.e.*, the 5 h.p. twin known as the Scout. The latter is a particularly attractive mount for solo riders. Although at first glance this machine appears to differ from the 7-9 h.p. Powerplus in size only, a closer inspection reveals the fact that it is in reality different in many respects, an interesting point being the double tube frame, which enables an extremely low centre of gravity to be obtained and great strength withal. The front forks are almost exactly similar to the cradle pattern fitted to the Powerplus. The engine is a very substantial unit, and is almost a miniature of the big 7-9 h.p. Mechanical pump lubrication is provided, the oil being drawn from the front compartment of the ordinary two compartment tank. A three-speed gear box with a kick-starter is fitted, forming one unit with the engine, though it is possible to separate them. An interesting feature, especially from a sidecarist's point of view, is that practically everything which is ever likely to require attention, such as chains, kick-starter, and many other similar fittings, so frequently hidden away on the left, and, consequently, inaccessible when a sidecar is fitted, are all situated on the right-hand side. Contrary to usual American practice, the wheels are 26in. in diameter instead of 28in. This also helps to keep the riding position very low. Another somewhat unconventional feature is the exhaust outlet arrangements. No expansion box is fitted, the exhaust pipes being led from the cylinders into a somewhat larger pipe flattened the end.



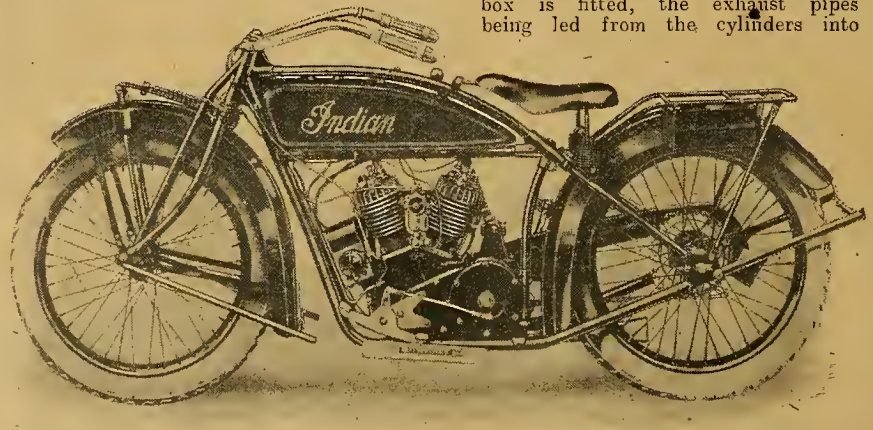
Complete electrical equipment is fitted on the 7-9 h.p. Powerplus model Indian.

7-9 h.p. V twin four-stroke MODEL 79×700 mm. (997 c.c.); side-by-side valves; Schebler carburetter; gear-driven magneto; spring frame three-speed gear; chain drive Goodyear 28×3in. tyres.

The 7-9 h.p. Powerplus is shown fitted to a very smart sidecar, and one is also to be seen solo. The points which differ from previous Indian practice are details only. For instance, the front fo connecting links are now drop forging and the bell cranks are much larger, t bearings of these are adjustable a fitted with large screw-down greaser There is also a greaser fitted for the lub cation of the rear spring frame hin joint.



Douglas frame tubes have been adopted o the new 8 h.p. Williamson.



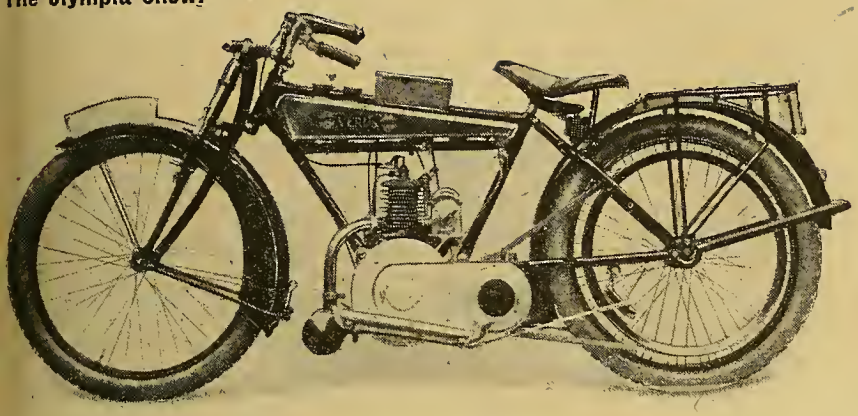
A solo model Indian, the 5 h.p. Scout, which has duplex loop frame without the rear springing associated with this make.

VERUS, No. 17a.

2¼ h.p. single two-stroke MODE 62×70 mm. (211 c.c.); Amac carb retter; E.I.C. magneto, ch driven; belt drive; Dunlop 24×2 tyres.

ALFRED WISEMAN, LTD., Glover Str Birmingham. — Although comparativ new to the motor cycle public, the Verus machines produced during 1 have performed consistently well in competitions this year. The Verus m its *début* in the London-Edinburgh r and was successful in securing for its ri a gold medal. Since then, howe Messrs. Wiseman have considerably tended their scope by the introduct of other models, two of which m their first public appearance at Olym The model exhibited is fitted with wheels, and the equipment, finish, general appearance are distinctly go

The Olympia Show.—



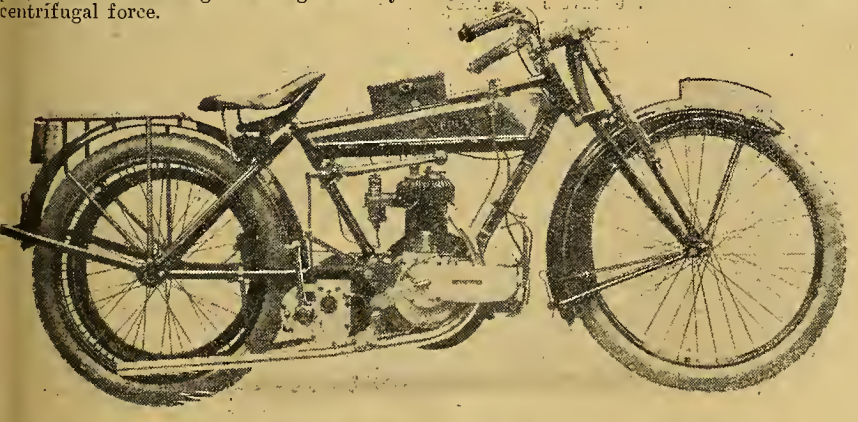
The 2½ h.p. two-stroke Verus, fitted with countershaft two-speed gear.

2½ h.p. single two-stroke MODEL: 70×70 mm. (269 c.c.); Amac carburetter; E.I.C. magneto, chain driven; Burman two-speed gear; chain and belt drive; Dunlop 26×2½in. tyres.

A more elaborate two-stroke model is the 2½ h.p., as it is fitted with chain-cum-belt drive and two-speed gear box, provided with a kick starter. One of its most notable features is the single aluminium casting which completely encloses the flywheel and the chain. It can be detached by removing three bolts. It is a commendable idea, and efficiently protects the most important parts of the engine, as well as preventing mud from being splashed upon the rider by the "outside" flywheel. A by-pass from the compression release to the exhaust pipe is fitted, thus preventing any noise when the compression is released. Both in this engine and on the smaller one, to which we have just referred, the lubrication is carried out in a thoroughly practical manner by means of a Best and Lloyd drip feed. The oil is first led to the base of the cylinder. After lubricating the piston it then drops down into a well at the top of the crank case, and from there enters two holes on each side leading to the main bearings. The crankshaft is drilled to register with the holes, and the oil passes through ducts in the webs of the crankshaft to the crank pin, thus lubricating the big end by centrifugal force.

2¾ h.p. single four-stroke MODEL: Blackburne; 70×88 mm. (339 c.c.); side-by-side valves; Amac carburetter; E.I.C. magneto, chain driven; Burman two-speed sliding gear; chain and belt drive; Dunlop 26×2½in. tyres.

Another practical type of mount is the Verus fitted with a 2¾ h.p. Blackburne engine, which suits the taste of the rider who needs a medium weight mount and yet does not care for a two-stroke. It is interesting that this is the only machine on the stand fitted with the Amac two-lever carburetter, all the others being equipped with the single lever variety.



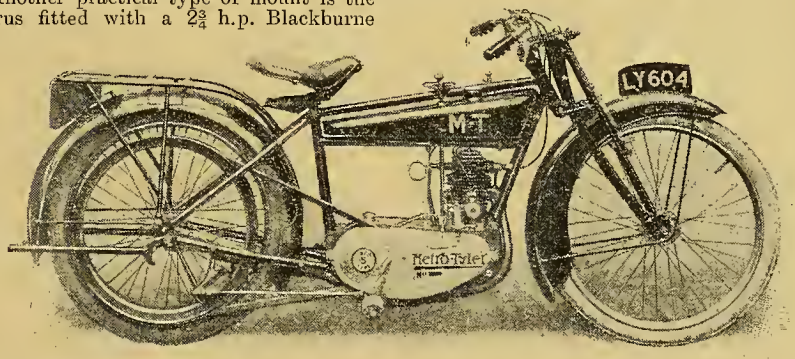
One of the newcomers into the motor cycle world—the Verus. The model shown has a Blackburne engine.

The fourth model is the 4 h.p. Blackburne engined machine, intended to meet the requirements of those who require a dual-purpose machine. It is fitted with the latest type of Sturmey-Archer three-speed gear box and kick starter. Both this and the lighter types have wide tanks and are well equipped. The power and transmission units employed being well known, need no more than a passing reference.

METRO-TYLER, No. 65.

2½ h.p. single two-stroke MODEL: 70×70 mm. (269 c.c.); Amac carburetter; C.A.V. magneto; two-speed gear (unit construction); chain and belt drive; 26×2¼in. tyres.

TYLER APPARATUS CO., LTD., Banister Road, Kilburn Lane, North Kensington, W.10.—Three machines of the two Metro-Tyler models are exhibited by the Tyler Apparatus Co. One of these is the new model, which has a rather distinctive frame, the seat tube being almost vertical. This and the front tube are one member, forming a wide loop, in which the engine and gear are fitted as a single unit. There are several features which



The 2½ h.p. Metro-Tyler has been redesigned for 1920, and now carries the engine and gears in a unit assembly.

make the machine worthy of a close inspection, which will reveal that the crank case, magneto, and gear box are fixed in the frame between two long side plates. These plates have an aluminium top, and so form a case enclosing the three units, and on the sides are aluminium covers enclosing the magneto and main drives, the belt emerging from a slot above the countershaft pulley. The whole assembly strikes one as being a very good job, and it will make a strong appeal to those who have long urged the desirability of enclosing the mechanism. Frequently newcomers to the pastime have hesitated on account of their ignorance of mechanics and the apparently complicated mechanism of a motor cycle. This model will go far to remove such impressions, besides keeping the rider free from grease. It should have a very ready sale. With its introduction, the Tyler Co. enter the manufacturing field as distinct from the fitting of proprietary units, as the machine is built throughout in the company's works. The other model exhibited follows more conventional lines, and both are finished in the deep maroon colour which has characterised Metro-Tylers since their introduction early in 1919.

The Olympia Show.—

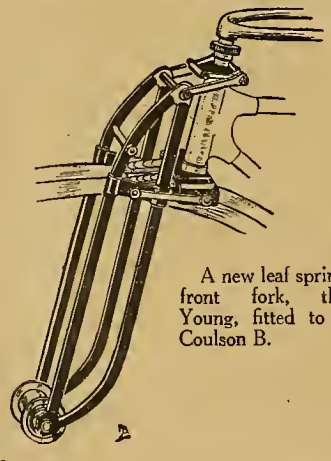
COULSON B, No. 16.

4 h.p. four-stroke MODEL: 85×88 mm. (499 c.c.); side-by-side valves; Capac carburetter; E.I.C. chain-driven magneto; single speed; belt drive; 26×2½in. tyres.

F. ASLETT-COULSON ENGINEERING CO., Albion Road, King's Cross, N.—Three Coulson motor cycles are staged on this stand. A new model which has not been shown previously is the 4 h.p. Blackburne-engined single gear sporting model, which is bound to appeal to the young motor cycle enthusiast, as it is of medium weight, does not possess the complications of a change speed gear, and yet has sufficient power for a high turn of speed and for hill-climbing under ordinary conditions. The Blackburne engine, with its large outside flywheel and excellent pulling powers at low speeds, is an excellent power unit for a single-geared mount, and from our own experiences with this engine we can safely prophesy good results. This model is fitted with the new Young spring forks. They are of the usual girder pattern, but employ two leaf springs connecting the rigid to the moving portion. The two-stroke model referred to later has a plated finish specially for the Show.

2¾ h.p. four-stroke MODEL: 71×88 mm. (350 c.c.); side-by-side valves; Capac carburetter; E.I.C. chain-driven magneto; Albion two-speed sliding gear; chain and belt drive; 26×2½in. tyres.

Another type which is more widely known among our readers and which has attained a considerable amount of well-deserved popularity is the 2¾ h.p. Coulson B, a machine with which we had some interesting experiences during the early part of the year. It has sufficient power to render it delightful for touring purposes, affording a good turn of speed on the level, and with a gear which will enable it to climb any hill this model should meet with a very ready demand. The chief points about the Coulson motor bicycles are the Capac single-lever carburetter, which certainly gives great satisfaction on these machines, the fitting of a new band brake, and a new stand, and, of course, the excellent spring frame. These points were referred to in our issue of November 20th.

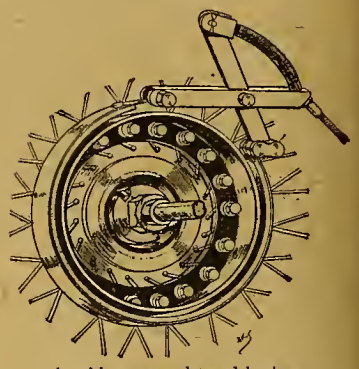


A new leaf spring front fork, the Young, fitted to a Coulson B.

2¾ h.p. two-stroke MODEL: 69×78 mm. (292 c.c.); Capac carburetter; Runbaken magneto; single speed; belt drive; 26×2½in. tyres.

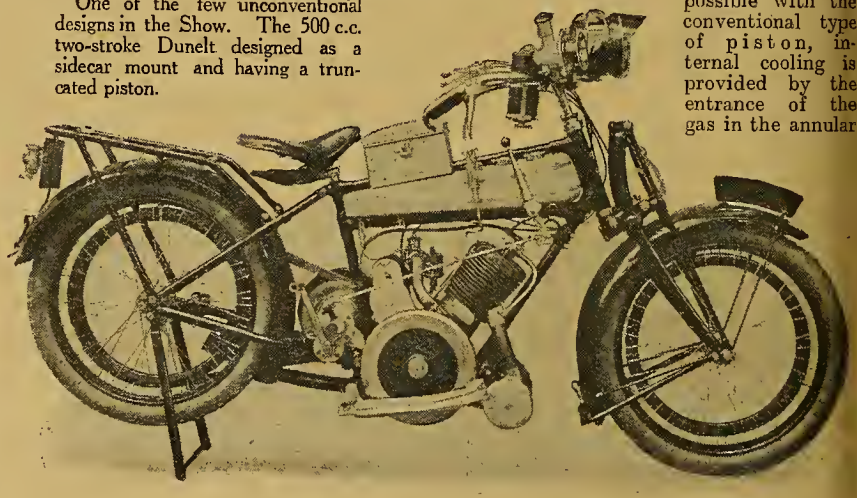
Unlike the other machines made by the F. Aslett-Coulson Engineering Co., the Coulson two-stroke is not fitted with a Blackburne engine, but with a Union two-stroke. This is of 2¾ h.p., and should appeal to the rider who is a novice and requires a machine of extreme simplicity and yet of solid construction and reliability.

Also shown on the Coulson stand is a Blackburne engine fitted with the David Lightning oscillating valve, which was described in *The Autocar* of July 5th, 1919. The combustion chamber is, roughly speaking, cast in the form of a hollow ball, in the interior of which is an oscillating valve mounted on trunnion bearings. The valve (in plan) is circular in shape, has rounded edges, with two step-cut rings, and is designed to fit closely inside the spherical combustion chamber. Opposite to each other in the combustion chamber are two ports—the inlet and exhaust—and on the side thereof is the sparking plug. This valve has an oscillating motion given to it by suitable means from the timing gear, and alternately covers and uncovers the inlet and exhaust ports. With the type of valve gear employed no springs are necessary, as the movement is positive. We understand that a number of well-known people are interested in the idea.



A cable-operated band brake is fitted to the Coulson B.

One of the few unconventional designs in the Show. The 500 c.c. two-stroke Dunelt designed as a sidecar mount and having a truncated piston.

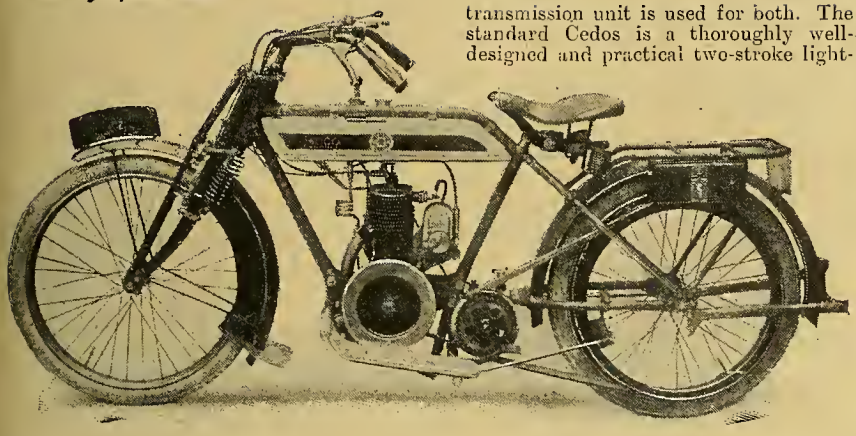


DUNELT, No. 33.

3½ h.p. two-stroke MODEL: 85×88 mm. (499 c.c.); Amac carburetter; chain-driven magneto; two-speed gear, expanding ring type; Dunlop 26×2½in. tyres.

DUNFORD AND ELLIOTT (SHEFFIELD), LTD., 96, Bath Street, Birmingham.—If only because it is by far the largest two-stroke engine in the Show, the new Dunelt 500 c.c. machine was bound to create a great deal of interest. Hitherto, all attempts to make a two-stroke engine of this size have met with but moderate success, but it is claimed that the inherent difficulties of a large two-stroke single-cylinder of the three-port type have been overcome in this model by the use of a truncated piston. In addition to providing a charge fully fifty per cent. larger than is possible with the conventional type of piston, internal cooling is provided by the entrance of the gas in the annular space above the trunk and outside the piston body. The engine exhibited strikes one as being a particularly massive unit, but, as placed in an inclined position in the frame, the appearance of the machine does not suffer. We are told that the nominal h.p. at which it will be rated has not yet been decided, as, although the engine is only of the same size as the four-stroke 3½ h.p. engine, the power developed is in the neighbourhood of 7 h.p. The change-speed gear is of the expanding ring type embodying a kick-starter. The mechanism is very neatly disposed in an aluminium case. The main drive is taken from the left side of the machine, while the large flywheel and the magneto chain drive are on the right. The Dunelt has the front and back wheels detachable and interchangeable. Each has a belt rim; when in the front position, the groove of the belt rim is used for the front brake. The mudguards are particularly wide, and the forks are of the girder variety, linked so as to give a rocking as well as the vertical motion. A leaf spring fork is used, the laminations being of chrome-vanadium steel.

The Olympia Show.—



Transmission side of the 2¼ h.p. Radco, a two-speed two-stroke model.

RADCO, Nos. 206 and 66.

2¼ h.p. two-stroke MODEL: 62×70 mm. (211 c.c.); Amac carburetter; Lion chain-driven magneto; single speed; belt drive; Dunlop 24×2in. tyres.

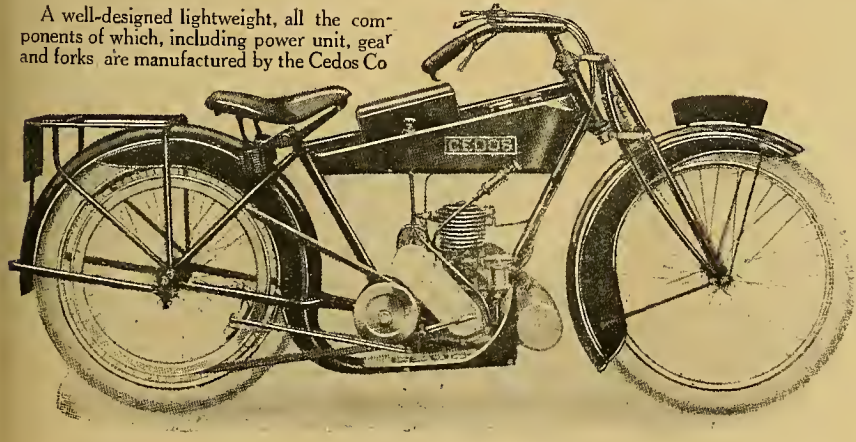
E. A. RADNALL AND CO., LTD., Dartmouth Street, Birmingham.—This firm has on exhibition several examples of the 1920 model which, in many respects, resembles the pre-war product. The engine is of the conventional three-port type, having a magneto platform cast at the rear of the crank case. The inner part of the magneto chain case, also, is integral, a construction and design which places the magneto well out of the way of mud thrown up from the front wheel. The frame follows conventional lines, and the forks now fitted are of the Druid type, while the equipment includes aluminium footboards, Xl-All saddle and two pannier bags. Both single and two-speed models are exhibited, the prices of which vary from £48 to £55.

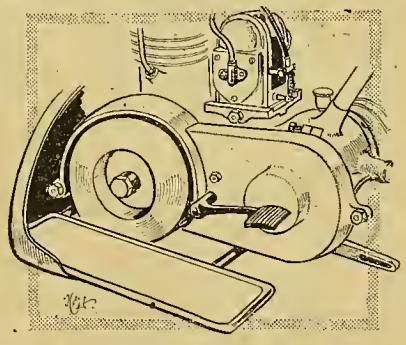
CEDOS, No. 18.

2½ h.p. two-stroke MODEL: 62×70 mm. (211 c.c.); Cedos carburetter; Runbaken chain-driven magneto; two-speed gear; chain and belt drive; 24×2½ Dunlop tyres.

HANWELL AND SONS COMPONENTS, LTD., Northampton.—Though two types of Cedos two-stroke motor bicycles are shown on this stand, the same power and transmission unit is used for both. The standard Cedos is a thoroughly well-designed and practical two-stroke lightweight in which a number of interesting features is embodied. The engine is of the three-port variety, of which the cylinder is an extremely light and strong casting, carefully ground as to the bore and combustion chamber so that no rough surfaces are left to encourage carbonisation. The exhaust ports are double, and are cut in the thickness of the cylinder wall only, thereby allowing an immediate expansion of the gas inside the enlarged passage to the exhaust bulb. The small end bearing is of large diameter, and is a grooved phosphor bronze bush with a slightly tapered hollow gudgeon pin. Lubrication is effected by the oil entering the cylinder wall through the collector slot on the side of the piston. The big end is fitted with Hoffmann roller bearings, while the main shaft runs on self-aligning ball bearings and finally on phosphor bronze bushes grooved so as to keep the oil in the crank case, and thus prevents crank case compression leakage. Particular attention has been paid to the balance of this engine. The engine should keep cool owing to its good design, and further to assist this the top radiating fin is of copper. In order to allow access to the one cylinder nut, which is shielded by the magneto chain case, on the undoing of one screw a large V-shaped piece can be taken out of the cover. The carburetter fitted is of the firm's own design. It has horizontal throttle and air tubes arranged in the direction of the flow of gas, and is so designed that it gives slow running without four-stroking. The gear box is of particularly neat design, is cylindrical in shape, and is mounted concentrically in a cylindrical lug. To take up any slack in the chain it is only necessary to undo one nut and insert a small tommy bar provided in the tool kit in a hole on the exterior of the gear box casting, when a couple of taps with a hammer will effect the required adjustment. The adjustment of the magneto chain is equally well provided for, as the magneto is mounted between two V-shaped wedge pieces, of which one is loose and the other a fixture, and the undoing of one nut allows the magneto to be slid in either direction without altering the chain line. As an example of the care displayed in the design of this motor bicycle we may mention that an undershield is fitted beneath the power unit, which is raised up in front so as to protect the rider's feet from mud, while there is only one separate clip on the machine, and that is on the down tube for the purpose of holding together the control wires. All other lugs, such as those for the brake brackets, are brazed on to the frame. Both brakes act on the rear wheel, one on the outside of the belt rim and the other on the inside; these are controlled by the rider's right and left feet. So far as the control is concerned, there are two double sets of control levers on the handle-bars, one set working the air and throttle, another the spark, and the fourth the change-speed mechanism.

A well-designed lightweight, all the components of which, including power unit, gear and forks are manufactured by the Cedos Co





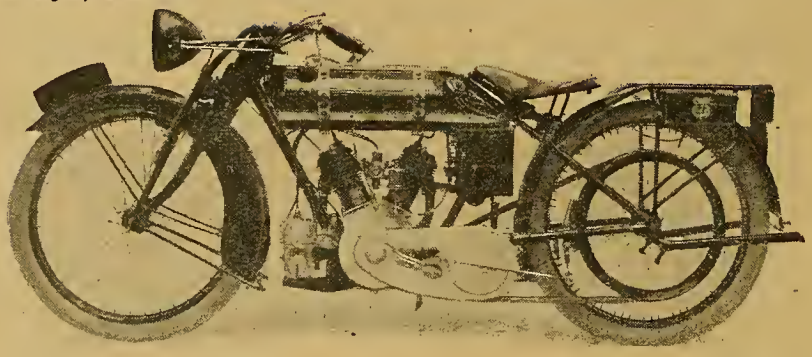
The Cedos flywheel and chain cover

N.U.T., No. 116.

3½ h.p. V twin four-stroke MODEL: 64.5×76 mm. (496 c.c.); side-by-side valves; Amac (two-lever) carburetter; Lucas Magdyno, chain driven; Sturmey-Archer three-speed; chain and belt drive; Palmer Cord 26×2½in. tyres.

NEWCASTLE-UPON-TYNE MOTOR CO., LTD., St. Thomas Street, Newcastle-upon-Tyne.—Several examples of the newly-produced N.U.T., the North-country production, which has created so great an interest in the motor cycle world. Built and designed after considerable experience in numerous T.T. races by a practical rider, the new N.U.T. is certainly a solo mount that will strongly appeal to all types of motor cyclists. Though built up of high-class component parts, the machine bears evidence of having been carefully designed in all its details. The engine is

The Olympia Show.–



Complete electrical equipment is somewhat rare on British so'o machines. The 3½ h.p. N.U.T. has the Lucas combined lighting and ignition Magdyno.

specially constructed for the firm by Messrs. J. A. Prestwich and Co., and the frame has been carefully adapted to take it whilst retaining the low position so generally favoured. Beneath the engine is a spacious aluminium silencer of shapely design, which greatly enhances the appearance of the machine. It is fitted with the Lucas Magdyno set, with the battery box attached to the saddle tube of the frame, and the lighting switch situated at the rear of the tank. Instead of trusting to the ordinary type of lamp bracket for the Lucas head lamp, the makers have specially cast lugs on the handle-bars, and have designed a light double member bracket carrying the lamp well forward and low down, so that there is a beam in just the correct position. The handle-bars are wide, and afford a comfortable riding position. The small petrol injector, instead of being carried loosely in the tool-bag is specially provided for in the head, being held securely by spring clips. The chain from the engine to the gear box is enclosed in a neat aluminium case, whilst the brake acting on the rear belt rim is of ample dimensions. Altogether, the N.U.T. is a really attractive mount, its well-balanced lines commanding appreciation.

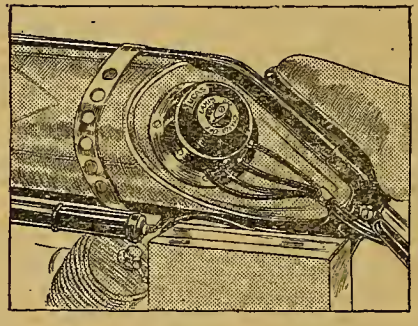
JOHNSON MOTOR WHEEL, No. 28.

Horizontal flat twin two-stroke MODEL: Johnson carburetter; magneto in flywheel, also acting as dynamo; chain drive; 26×2in. tyres.

W.T.T. ENGINEERING CO., LTD., 6-10, Dalling Road, Hammersmith, London, W.1.—The Johnson motor wheel was recently described in *The Motor Cycle*. This is one of the most practical forms of motor attachment for pedal cycles. The power unit is a horizontal flat twin two-stroke with a flywheel magneto, which also acts as a dynamo, and a special rear wheel chain-driven and equipped with a spring drive.

BOWN-VILLIERS, No. 148.

2½ h.p. Villiers two-stroke MODEL: 70×70 mm. (269 c.c.); Amac carburetter; C.A.V. chain-driven magneto; two speeds, Sturmey-Archer or Albion gear; chain and belt drive; 26×2½in. Dunlop tyres.



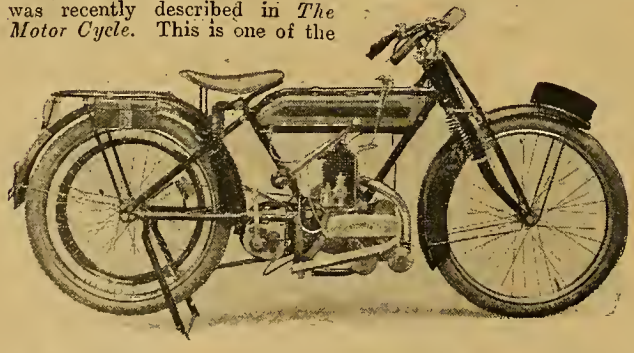
The latest model N.U.T. has a switch-box fixed on the rear of the tank.

BOWNS, LTD., Æolus Works, Summer Lane, Birmingham.—Bown motor cycles were commencing to gain an enviable reputation for sound design before the war placed a temporary restriction on their output. One of these machines now reappears on the stand of Chas. B. Timperley and Co. in the Gallery, and examination reveals much of the care which has been exercised in its design. While it follows conventional specification, special attention has been paid to details. Large hubs are fitted, $\frac{7}{16}$in. spindles being used, while, to eliminate cranking of the rear brake rod, a specially designed pedal has been made which leads the control behind the flywheel. The price, with two-speed hand-controlled clutch and kick-starter, is £65.

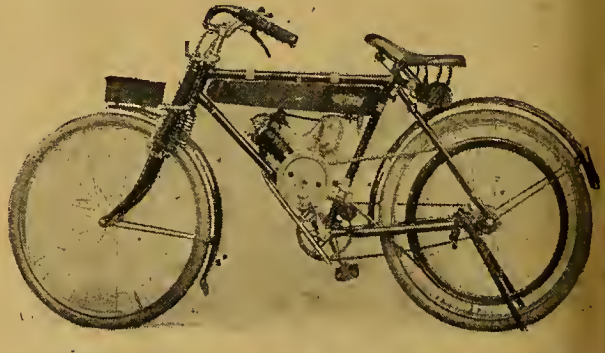
J.E.S., No. 39.

1 h.p. single four-stroke MODEL: 55.6×60.3 mm. (146.4 c.c.); overhead m.o. inlet valve; J.E.S. floatless carburetter; Lion magneto, chain driven; single speed; belt drive; Dunlop 26×1¾in. tyres.

J. E. SMITH, J.E.S. Motor Works, Gloucester.—An exceedingly interesting little lightweight, the power unit of which is well worth a careful study. The inlet valve is of the overhead variety, and the tappet mechanism is entirely enclosed. There is a sump at the base forming part of the crank chamber, and oil is delivered from this by means of a pump submerged therein to the principal bearings. Owing to an ingenious arrangement, the hollow floating gudgeon pin receives oily vapour, and is adequately lubricated. There is only one bearing, that on the flywheel side, the flywheel being of the external variety, and the crankshaft has a flying balance weight and an extension driving the timing gear. The piston is of aluminium. Gas is fed to the engine through a floatless single lever carburetter. The other lever of the two on the handle-bars raises the exhaust valve for starting. The J.E.S. is not, strictly speaking, a motorised bicycle, although the unit is designed to fit into the diamond frame of an ordinary cycle. The makers, however, prefer to sell it as a complete unit. It has been very carefully thought out, and is a very fine piece of design. The comfort of the rider has been well studied, and Druid spring forks of the lightest pattern are provided. The transmission is by Whittle belt, the tension of which can be varied by means of a jockey pulley. A front rim brake is fitted while the rear brake is of the coaster pattern. It is clearly the lightest motor bicycle made at the present time.



The 2½ h.p. Bown-Villiers two-stroke two-speed lightweight for 1920.



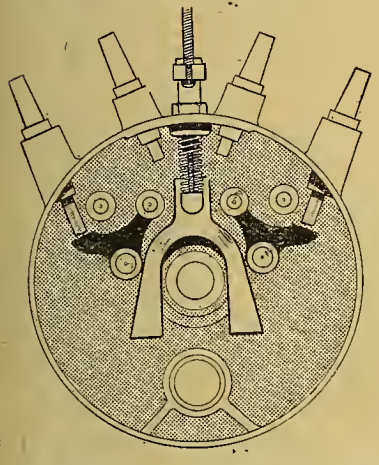
The latest J.E.S. ½ h.p. motor bicycle, probably the simplest machine in the Show.

The Olympia Show.—

CLYNO, No. 103.

8 h.p. V twin MODEL: 76×102 mm. (925 c.c.); side-by-side valves; Amac carburetter; T.B. magneto, chain driven; spring frame; three-speed sliding gear; chain drive; 28×3in. wheels.

CLYNO ENGINEERING CO., LTD., Pelham Street, Wolverhampton.—One of the most attractive sidecar machines in the whole Show is the new model Clyno.



The interior of the Clyno timing case showing exhaust lifter gear. When the control forked member is lifted by the Bowden control, the exhaust rocker arms are forced outwards, thus raising the exhaust valves.

Two sidecar outfits are shown, while one of the famous machine gun outfits which has been dug up from some Government dump is also exhibited, and will undoubtedly prove a point of interest to the many members of the Machine Gun Corps, who propose to meet at this stand during the Show. In addition the little lightweight two-stroke is also shown. To describe fully the many interesting points would occupy too much space, so we must content ourselves with just a few of the most notable details. The engine is of extremely neat appearance, and, an entirely new feature for the Clyno, is fitted with detachable cylinder heads. The spark plug is situated in a pocket of its own directly over the inlet port, the valve caps being thus unhampered, and provided with cooling fins. The engine is lubricated by means of a mechanical pump, which is of the vane type, and derives oil from the tank *via* a sight-feed regulator. From the pump the oil passes to the front cylinder, and thence by splash to other parts. All surplus oil which reaches the rear cylinder passes by means of a duct again to the front. The exhaust lifter mechanism is also extremely neat, all the Bowden working mechanism being readily accessible outside the engine and easily removed for replacement. These machines are finished in slate grey with black lines and black guards and forks, which give a most elegant and serviceable appearance. All parts of the machine are unusually accessible, and the appearance throughout is both extremely pleasing to the eye and at the same time very practical. The sidecar is of Clyno manufacture, and is fitted with a windscreen; it is extremely roomy and comfortable.

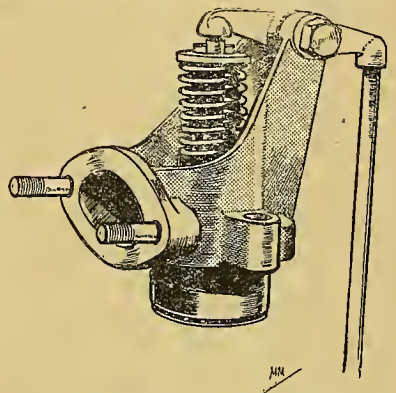
2½ h.p. two-stroke MODEL: 70×70 mm. (269 c.c.); Amac carburetter; gear-driven magneto; two-speed integral with crank case; belt drive; 26×2in. wheels.

The Clyno lightweight, which has now been on the market for a considerable number of years, and has proved itself to be one of the finest machines of its class, is unaltered in its principal features. The compact engine and gear unit is a feature which is at once most noticeable, incorporating as it does the two-speed gear and metal-to-metal plate clutch, with final belt drive. The front pulley is protected by a cast aluminium shield. Beyond the engine unit the machine is conventional. Lubrication is by drip feed to the transfer port, which method gives the dual advantage of drip feed and petrol-oil systems.

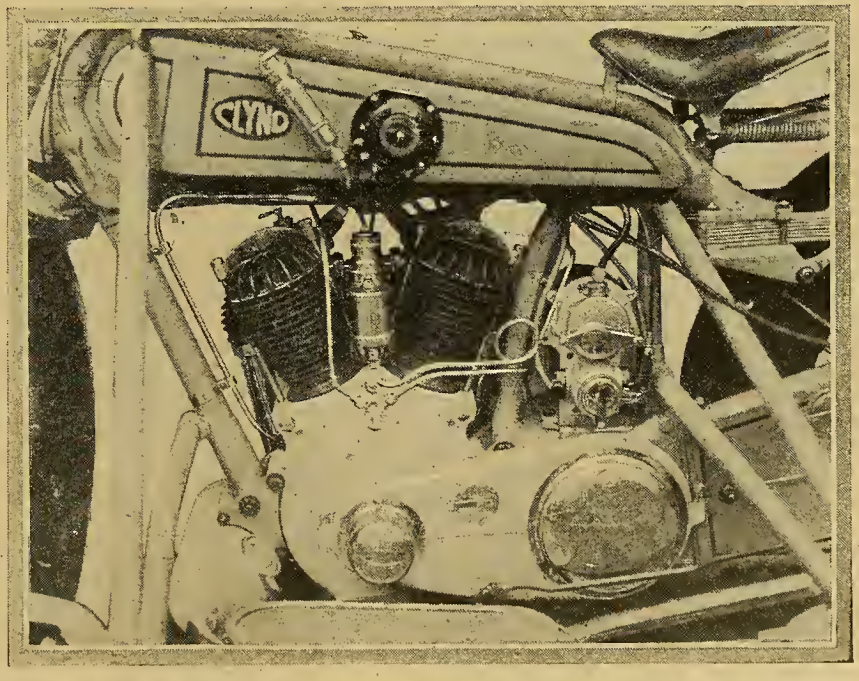
MARTINSYDE-NEWMAN, No. 43.

6 h.p. V twin four-stroke MODEL: 70×88 mm. (680 c.c.); overhead exhaust valves; Amac carburetter; M-L magneto, chain driven; three-speed sliding gear; chain drive; 650×65 mm. tyres.

MARTINSYDE, LTD., Maybury Hill, Woking.—Shown to the public for the first time at Olympia, the new Martinsyde cannot fail to attract attention. Designed by a well-known motor cyclist in conjunction with the experts of an equally well-known aeroplane works, with excellent facilities for production, this machine starts with every hope of success. One of the chief features of the engine is the disposition of the valves, the exhaust valve being above the inlet. The ports are of the streamline variety, so that the maximum amount of efficiency can be anticipated. Adjustable tappets are, of course, fitted. The deeply waisted pistons are of cast iron, are light, and have one ring fitted at the top and one ring at the bottom, while the gudgeon pins are held by a split ring—a system often adopted in aeroplane practice. Lubrication is by splash, and the carburetter chosen for the coming year is the single-lever Amac. Quite a good feature is the carrying of the M-L magneto in an aluminium watertight case provided with inspection doors so that it can be rendered accessible in a moment. Messrs. Martinsyde, Ltd., have been very wise in their choice of a gear box, having adopted the A.J.S. three-speed countershaft gear incorporating a cork insert clutch and kick-starter, and this they intend to manufacture under licence. The

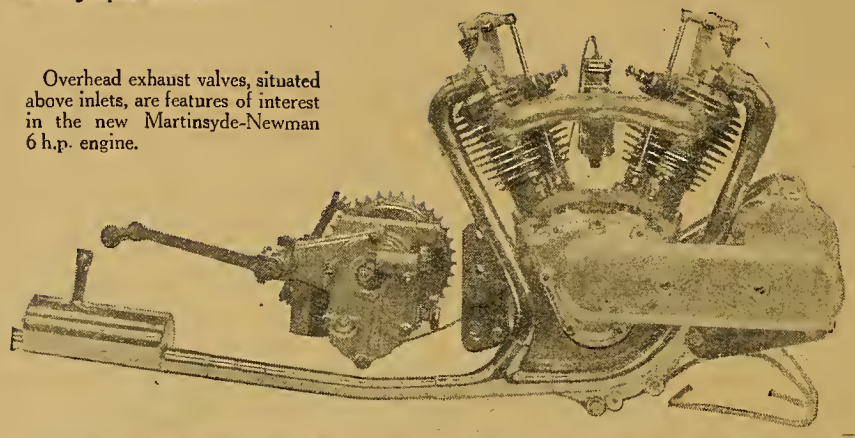


Overhead exhaust valve cage on the 6 h.p Martinsyde. Note the flanged joints.



Power unit of the 1920 model 8 h.p. Clyno sidecar machine. Attention is drawn to the mounting of the Lucas Magdyno and the switch on the tank.

The Olympia Show.—



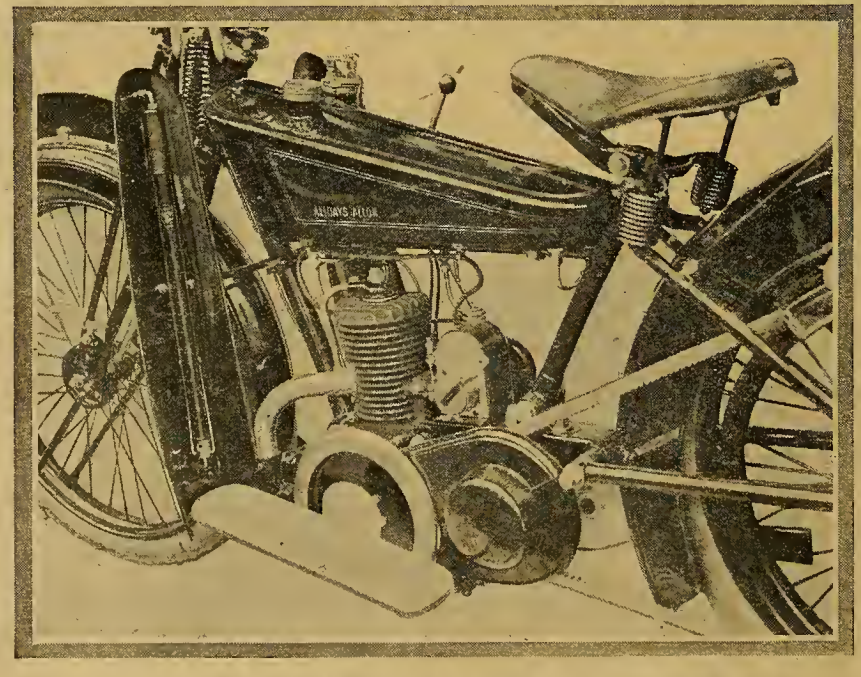
Overhead exhaust valves, situated above inlets, are features of interest in the new Martinsyde-Newman 6 h.p. engine.

transmission is by chains enclosed in oil-tight cases. A foot-controlled external band brake working on a drum of large dimensions is fitted on the rear hub and the front brake on the Brampton spring forks is of the conventional shoe type. A hood and an Auster screen form part of the sidecar equipment.

ALLON, No. 104.

2¾ h.p. single-cylinder two-stroke MODEL: 70×76 mm. (292 c.c.); B. and B. carburetter; chain-driven magneto; two-speed sliding gear with clutch and kick starter; chain-cum-belt drive; 26×2¼in. tyres.

ALLDAYS AND ONIONS, LTD., Birmingham.—Messrs. Alldays and Onions are showing three of their machines, all of which are of the same model and differ very slightly from the firm's previous productions, which have won for themselves a name as most substantial and roadworthy lightweights. The engine is of special design, and has many interesting points. The cylinder and top half of the crank case are cast in one, and access to the piston for cleaning, etc., is obtained by dropping the lower half of the crank case, a very simple process in this design. The crankshaft, connecting rod, and piston may then be withdrawn. This firm was one of the first to adopt the sloping type top tube, thus enabling a very low riding position to be obtained, and it has for a considerable time fitted external contracting band brakes to both wheels, the front being operated from the handle-bar, while the rear is applied by the usual pedal. A two-speed gear box is fitted, and has a handle-bar controlled clutch and a substantial kick-starter. The tank has a flush top, which is now becoming popular on other makes, and not only gives a very neat appearance, but obviates the difficulty of cleaning dust and dirt from beneath the top tube. This model is priced at £70.

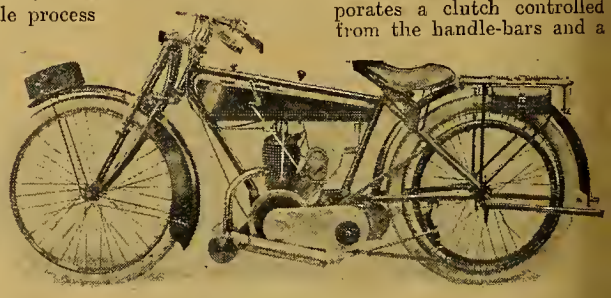


A distinctive two-stroke, the Allon, which has a large saddle tank and high leg shields.

OLMYPIC, No. 123.

2½ h.p. two-stroke MODEL: 70×70 mm. (269 c.c.); Amac carburetter; chain-driven magneto; two-speed gear; chain-cum-belt drive; 26×2¼in. tyres.

OLYMPIC CYCLE AND MOTOR CO., LTD., Granville Street, Wolverhampton.—The Olympic is a nice little machine built on modern lines, the power unit being the Verus two-stroke. This engine is fitted with an external flywheel, and outside the flywheel there is a chain sprocket, the chain being enclosed in an aluminium case, conveying the drive to the countershaft gear, which incorporates a clutch controlled from the handle-bars and a kick starter. One of the most interesting features of the machine is the suspension of the gear box, which is attached to a special bracket, the centre of which is pivoted from the bottom bracket of the frame. The forward end of the plates forming this bracket is slotted, and there are two small distance screws also at the forward end and above the slot bolts. To adjust the chain it is only necessary to loosen the pivoting bolts and the slot bolt, and give a very slight movement to the distance bolts, when the gear box is displaced sufficiently to allow the necessary chain adjustment. The construction of the frame is not without interest, as there are no curved tubes; also, a special flat is provided underneath the rearward portion of each chain stay, against which the legs of the stand abut. The handle-bars, we may mention, are wide, and should give an excellent control of the machine on rough roads. Footboards of ample dimensions are fitted. The tank is wide and of ample capacity for fuel and oil.



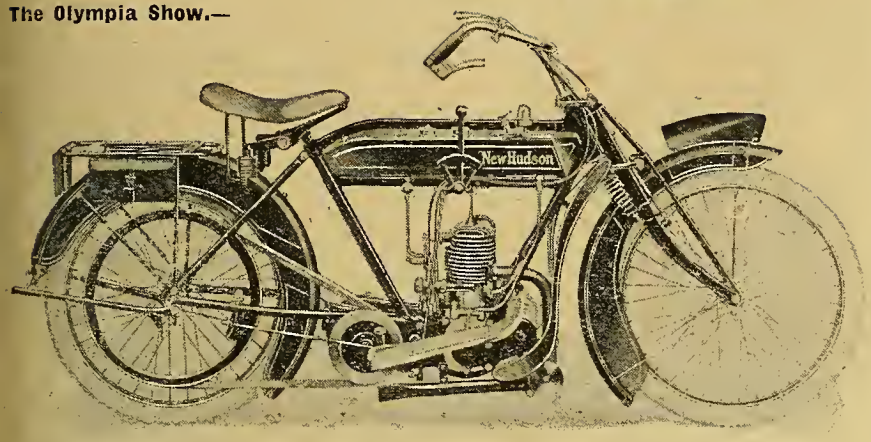
The Olympic-Verus two-speed chain and belt driven machine.

NEW HUDSON, No. 74.

2¼ h.p. two-stroke MODEL: 62×70 mm. (211 c.c.); B. and B. carburetter; chain-driven magneto; two-speed gear; chain-cum-belt transmission; 24×2in. tyres.

NEW HUDSON CYCLE CO., LTD., Icknield Street, Birmingham.—For 1920 the New Hudson Co. will concentrate on a

The Olympia Show.—



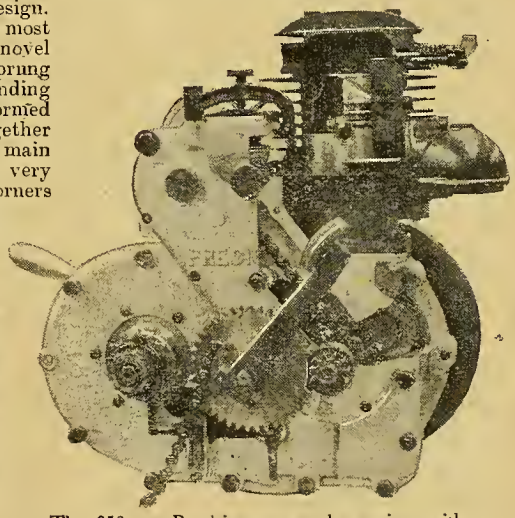
A lightweight *de luxe*. The touring model two-stroke 2¼ h.p. New Hudson, fitted with deep mudguards, leg guards, and footboards.

2¼ h.p. two-stroke model, having stopped production of their larger types. The two-stroke will be produced in quantity, and is a very handy little runabout. The engine is designed on standard two-stroke lines, and is of the three-port type, lubrication being by means of sight feed drip and a branched pipe which leads to the base of the cylinder and the magneto drive side bearing. The release valve is connected to the silencer, so as to avoid noise, and it is actuated in a particularly neat manner by a little plunger operated from a bracket on the lower tank rail. From the engine the drive is taken to the two-speed countershaft gear by an entirely enclosed chain, final drive being by belt over a large diameter front pulley. Mudguarding has received special attention, and in addition to full valances on both guards both aluminium footboards and leg shields are fitted. The rear brake acts on the outside of the V of the belt rim.

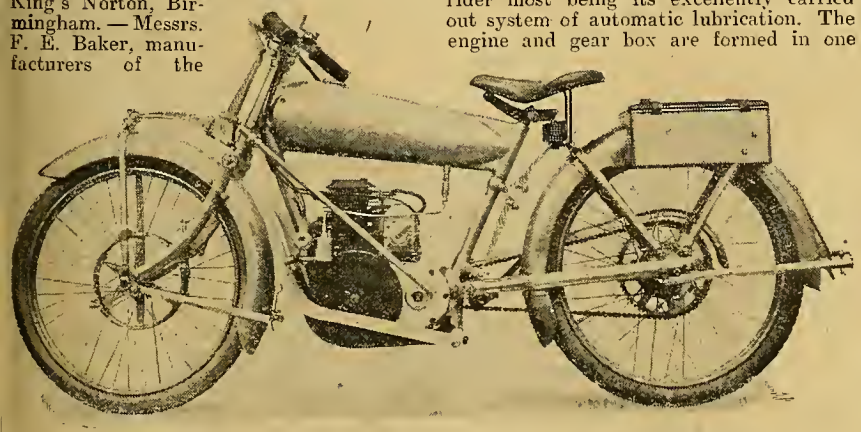
BEARDMORE-PRECISION, No. 95.

3½ h.p. single two-stroke MODEL: 74×81 mm. (350 c.c.); Amac carburetter; Thomson-Bennett magneto; chain driven; spring frame; two-speed gear, expanding ring type, integral with crank case; chain drive; 26×2¼in. Dunlop tyres.

F. E. BAKER, LTD., Precision Works, King's Norton, Birmingham.—Messrs. F. E. Baker, manufacturers of the famous Precision engine which has been so well-known for many years, are now introducing, in conjunction with the famous aeroplane firm of Beardmore, a lightweight of most distinctive design. Possibly the feature which is most noticeable at first glance is the novel construction of the frame, which is sprung both back and front, its outstanding distinction being that the tank is formed of two steel pressings welded together and taking the place of the top main tubes of the frame. This gives a very clean appearance, there being no corners or crevices for the collection of dust and dirt. Another extremely novel feature of the frame is the fact that the mudguards, which are also steel pressings, form essential parts of the frame, acting as they do in the dual capacity of mudguards and triangulating the front and back units of the construction. This not only affords very great strength, but also ensures most excellently rigid guards and obviates a number of flimsy stays. The springing, both back and front, is on the cantilever principle and extremely original in design. The back stays are hinged at the bottom bracket on ball bearings, which are naturally adjustable for wear. The engine has many novel features worthy of notice, the one which possibly appeals to the average rider most being its excellently carried out system of automatic lubrication. The engine and gear box are formed in one unit, and the gearing, which is of the double chain variety, actuated by expanding clutches mounted on the crankshaft, is entirely enclosed in the crank case and runs in the oil sump. An interesting point in connection with the gears is that, although double chains are used, each chain is independently adjustable by means of arms on either side of the crank case working in a quadrant. By turning these arms jockey sprockets, working on eccentrics, take up any slack which may exist in that chain. The brakes also are novel, the footbrake, which is of the contracting band type, acting inside the gear box. The front brake also has a contracting band of ample dimensions. Another point which attracts one's attention is the carrier, which is composed of a steel box and is fitted out with recesses specially designed for the holding of tools and spares. This also gives a neat appearance and obviates many corners for the collection of dirt. Aluminium footboards are fitted in which the front ends are upturned, forming very effective leg guards. All the controls are operated from the handle-bar with the exception of the foot brake, and both the front brake and compression release valve are operated by roller levers.



The 350 c.c. Precision two-stroke engine, with sections cut away to show the design of the internal parts.



A striking exhibit is the all-steel 350 c.c. spring frame Beardmore-Precision.

HOBART, No. 106.

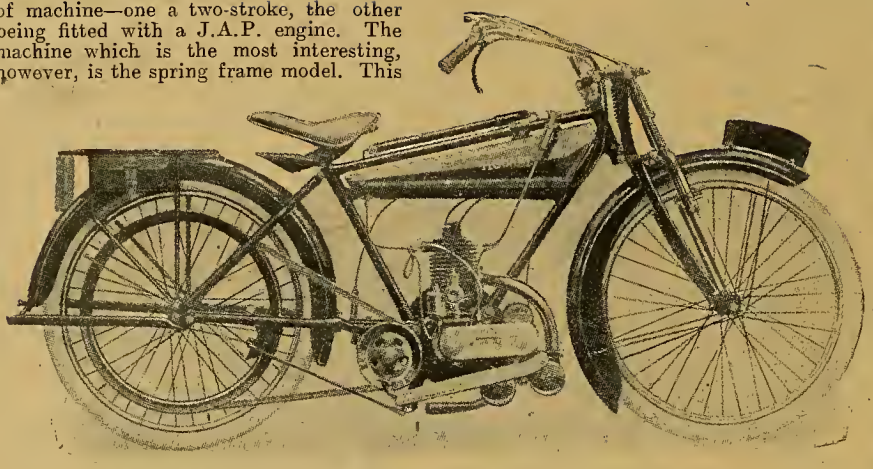
2¾ h.p. four-stroke single-cylinder MODEL: 70×76 mm. (292 c.c.); side-by-side valves; Amac carburetter; C.A.V. chain-driven magneto; spring frame; two-speed Sturmey-Archer gear; chain-cum-belt transmission; 26×2¼in. Dunlop tyres.

2½ h.p. two-stroke MODEL: 70×70 mm. (269 c.c.); Amac carburetter; C.A.V. chain-driven magneto; two-speed Sturmey-Archer gear; chain-cum-belt drive; 26×2¼in. Dunlop tyres.

HOBART CYCLE CO., LTD., Coventry.—Messrs. Hobart have on view two types

The Olympia Show.—

of machine—one a two-stroke, the other being fitted with a J.A.P. engine. The machine which is the most interesting, however, is the spring frame model. This



Exceedingly neat frame design characterises the 2¾ h.p. two-stroke Hobart.

suspension is extremely neat and inconspicuous. It is original, and differs from the majority of spring frames in that the springing is carried out by means of coil springs, and is very similar in action to the usual form of front spring fork. It is very neatly arranged, and, having a 6in. bearing where the rear frame hinges alignment is ensured. Front springing is by Brampton Biflex fork. The sloping top tube and torpedo-shaped tank, which has a flush top entirely covering the frame tube, give a neat and cleanly appearance. These machines are fitted with two-speed gear boxes with kick starters; the two-stroke model, however, has handle-bar control for the gears and no clutch. All models have Best and Lloyd pump lubrication. A front rim brake with Bowden control is fitted, that at the rear being of an improved pattern worked on the inside of the belt rim. The machines are finished in all-black, and are shown with both touring and T.T. bars, and a single-geared two-stroke is listed.

ELSWICK, No. 97.

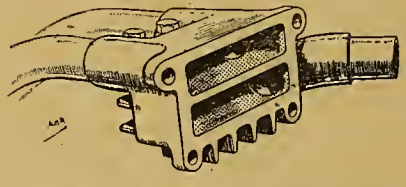
3½ h.p. single two-stroke MODEL: 74×81 mm. (348 c.c.); Amac carburetter, Thomson-Bennett chain-driven magneto; two-speed Sturmey-Archer gear; chain and belt transmission; 26×2¼in. Dunlop tyres.

ELSWICK HOPPER CYCLE AND MOTOR CO., LTD., Barton-on-Humber.—On this stand are shown two motor cycles. Both machines are identical, except for finish, though one is known as the Elswick and the other as the Torpedo. The Elswick is an extremely neat lightweight, fitted with a Precision 3½ h.p. two-stroke engine, which has sump lubrication, as described in the Beardmore-Precision. The machine is quite simple, and on strictly conventional lines. It is finished in the well-known Elswick shade of green, and lined with gold, and has a particularly distinctive appearance. The engine chain is neatly encased, the cover also enclosing the outside flywheel. A Sturmey-Archer two-speed gear box with kick-starter is fitted, and the machine has Brampton Biflex spring forks.

CONNAUGHT, No. 102.

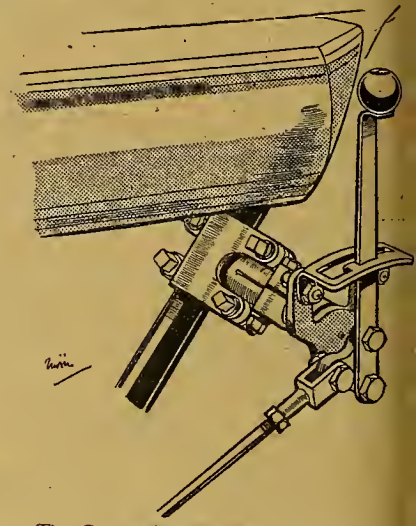
2½ h.p. single two-stroke MODEL: 73×70 mm. (293 c.c.); Amac, B. and B., or Senspray carburetter; B.L.I.C. chain-driven magneto; single or two-speed; sliding dog gear; 26×2¼in. Dunlop tyres.

BORDESLEY ENGINEERING CO., LTD., New Bond Street, Birmingham.—Two



Combined exhaust and inlet pipe casting on the Connaught two-stroke. The lower port passes the mixture from the carburetter to the cylinder, considerably cooling the exhaust port above, and the gases passing through the twin pipes to the silencer. The exhaust gases in turn heat the mixture entering the cylinder.

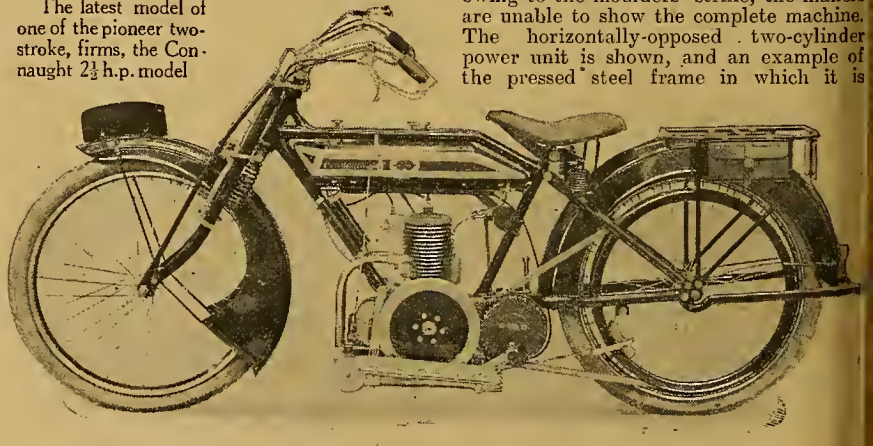
types of this machine are exhibited—one the standard, which is shown as a single gear model and also as a two-speed model with chain-cum-belt drive; the other, the Connaught miniature, which is a smaller machine, but with the same sized engine. This also is shown as a single-speed and as a two-speed. A notable feature in the construction of the engine, and a point which this firm was the first to adopt, is the combined exhaust and inlet manifold, which allows the incoming gases to cool the exhaust port and the ingoing cold charge to be heated—a considerable advantage on a two-stroke. Another interesting point in the construction of this engine is the size of the crankshaft and bearings, which are very substantial indeed. Petroil lubrication is used, and a measure is fitted to the machine between two pump clips, which is quickly acces-



The Connaught change-speed bracket is clamped to the front down tube, the operating lever thus being accessibly placed.

sible. The oil tank is provided with a pump for withdrawal of the oil for admixture with the petrol. The miniature model is a very handy little mount, especially for town work. The machine generally is of orthodox design, and is nicely finished.

The latest model of one of the pioneer two-stroke, firms, the Connaught 2½ h.p. model



BLACK PRINCE, No. 42.

4 h.p. two-stroke flat twin MODEL: 73×60 mm. (500 c.c.).

BLACK PRINCE MOTORS, LTD., Barnard Castle, Co. Durham. — Unfortunately, owing to the moulders' strike, the makers are unable to show the complete machine. The horizontally-opposed two-cylinder power unit is shown, and an example of the pressed steel frame in which it is

The Olympia Show.—

proposed to mount it. The engine of the 4 h.p. horizontally-opposed two-cylinder motor cycle has been increased in dimensions since the time it was first described in *The Motor Cycle* of July 24th last. The bore and stroke are now 73×60 mm., and, whilst the engine is rated at 4 h.p., it is claimed that it develops 8½ h.p. on the brake. It will be recollected that a feature of particular interest in this engine is the common combustion chamber for the two cylinders. The construction of the engine is extremely simple, the entire power unit consisting of only two castings, which are similar. The gases enter into the lower part of the rear cylinder, and are passed by crank case compression into the common combustion chamber, where they are fired by a single sparking plug placed in the centre. Admission into this combustion chamber is through a small automatic valve. It is claimed by the makers that a particularly uniform flow of gases is obtained by their system, a comparatively slow flame propagation being produced. Underneath the engine is attached a large aluminium silencer of rectangular form, which is rigidly bolted up to the two exhaust ports, and forms a part of the power unit; it is also used for the attachment to the frame.

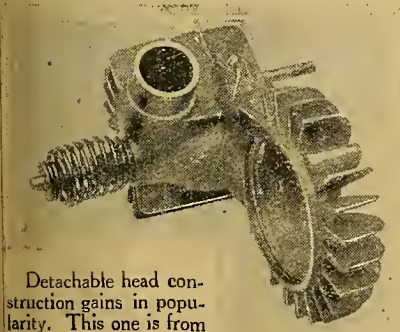
A smaller model of the pressed steel frame is also shown, which is fitted with a Union single-cylinder two-stroke engine.

In addition to these two motor cycles, a new Black Prince four-wheeled runabout is being demonstrated outside Olympia. This machine is very interesting. A two-cylinder two-stroke engine is fitted, 70 mm. bore by 78 mm. stroke, giving a cubic capacity of 670 c.c. The R.A.C. rating is 6 h.p., but the power developed on the brake is said to be 9 h.p. The engine is, in fact, two single-cylinder two-stroke engines fitted together.

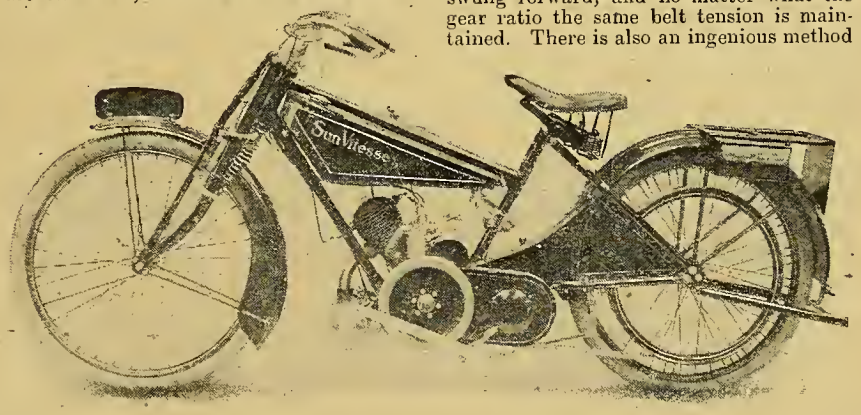
SUN, No. 57.

2½ h.p. two-stroke MODEL: 70×70 mm. (269 c.c.); B. and B. carburetter; chain-driven magneto; two-speed constant mesh gear; chain and belt drive; 26×2in. tyres.

SUN CYCLE FITTINGS CO., LTD., Birmingham.—Two models of the new Sun lightweight are staged by the Sun Co. The two types differ only in frame construction, one being more or less on conventional lines, and the other a drop frame model, which will appeal to lady motor cyclists. In both models the three-port two-stroke engine has the cylinder placed inclined in a forward position. The engine itself is of simple construction embodying the crank case, which consists of a main body and a recessed side plate. A single plain bearing and of good length supports the main shaft, the crank being of the one web type. This construction brings the flywheel, main drive, and magneto drive all on one side, and to distribute the weight evenly at each side of the centre line of the machine, the cylinder is offset in the frame. On the drop frame model the guarding is exceptionally well carried out in metal, a dress shield forming part of the rear mudguard between the two pairs of rear stays. The magneto chain and driving chain are protected by a combined guard, which also embodies a cover for that portion of the belt between the countershaft and the rear mudguard, which, incidentally, is exceptionally wide for a machine of its size. Both two and single-speed models are exhibited, and kick-starters are fitted on all the former. An all-black finish with gold lines has been adopted for most of the machines, but in the centre of the stand there is one model finished in stone grey with red lines.



Detachable head construction gains in popularity. This one is from the engine of the 2¾ h.p. flat twin Wooler.

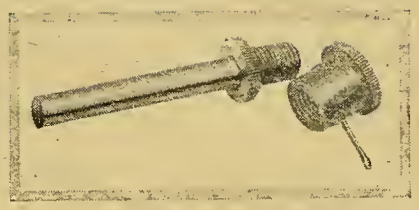


The open frame Sun-Vitesse two-speed mount suitable for the use of either sex.

WOOLER, No. 47.

2¾ h.p. flat twin four-stroke MODEL: 60×60 mm. (340 c.c.); overhead inlet valves; B. and B. carburetter; gear-driven magneto; spring frame; nine-speed expanding pulley gear; belt drive; Palmer 26×2¼in. tyres.

WOOLER ENGINEERING CO., LTD., Alperton, London.—Two types of Wooler motor bicycles are to be seen on this stand. Of these, the T.T. type has dropped handle-bars and footrests, while the touring model, fitted with upturned handle-bars and footboards, is mounted on a platform. A model of the variable pulley is also shown, also an engine with the timing gear cover removed. There is a nickel-plated section of the frame showing the springing and various parts. The 2¾ h.p. Wooler was the first entirely new motor bicycle to be described in our pages after the Armistice, and was fully described in the issue of November 28th, 1918. It has many interesting features. Among these may be mentioned the enclosed inlet valve mechanism and the ingenious system of lubrication. Oil is



Tappet adjustment on the Wooler flat twin may be effected by the finger's when the split-pin is withdrawn.

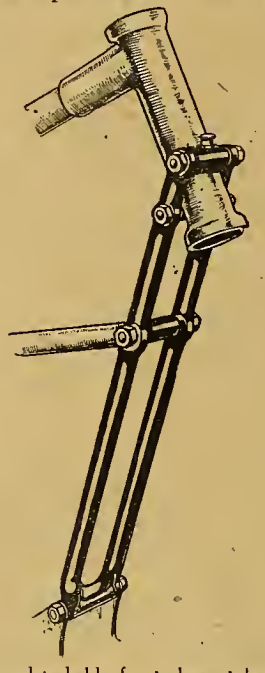
delivered *via* a chain driven off a sprocket on the timing-shaft through the timing gear case, and thence into the crank case, in which a constant level of oil is maintained. The big ends dip into this oil, and the rest of the moving parts are lubricated by splash. The ingenious pulley gear is also well worthy of inspection. The pulley is under-geared, and is so arranged that it is expanded as it is swung forward, and no matter what the gear ratio the same belt tension is maintained. There is also an ingenious method of taking up any slack in the belt by sliding the gear forward. The frame is suspended fore and aft on enclosed coil springs. The Wooler is distinctive in appearance, and is full of ingenious points.

DIAMOND, No. 119.

2¾ h.p. four-stroke MODEL: 70×76 mm. (293 c.c.); side-by-side valves; Amac carburetter; C.A.V. chain driven magneto; two-speed Enfield gear; chain and belt drive; 26×2¼ Dunlop tyres.

D.F. AND M. ENGINEERING CO., LTD., Vane Street, Wolverhampton. — The standard four-stroke is a very practical little machine fitted with the latest type 2¾ h.p. J.A.P. engine, footrests, chain-cum-belt drive, the chain being enclosed in an aluminium case. The gear is of the Enfield variety, giving two speeds, while the brake is of simple design, and is actuated by the driver's heel, the pedal giving ample leverage, thus rendering the brake extremely powerful. The newest model of this type, which will be delivered early next year, possesses several important improvements. The tank now holds just under two gallons of petrol. Comfortable aluminium footboards are provided. The mudguards are much wider, giving far better protection to the rider than previously, and the same

The Olympia Show.—
efficient type of footbrake is fitted. Considerable improvement has been made in the frame design. The down tube is of the duplex variety and made in two portions, of which the upper is a steel pressing bolted fore and aft of the head tube. The lower portion enters, and is brazed into, the duplex tubes. This arrangement



The detachable front down tube of the Diamond J.A.P. lightweight.

tends to great strength, and in the unlikely event of a frame breakage a new portion can be inserted instantly, and without trouble. The horizontal tube beneath the tank is detachable.

2¾ h.p. two-stroke Villiers MODEL: 70×70 mm. (269 c.c.); Amac carburetter; C.A.V. chain-driven magneto; two-speed Sturmey-Archer gear; chain and belt drive; 26×2¼in. Dunlop tyres.

The Diamond two-stroke is a very smart little model fitted with a Villiers engine, built into a frame which, except for the engine bracket, is interchangeable with the four-stroke frame. Comfortable aluminium footboards are provided, and a two-speed lightweight Sturmey-Archer gear is employed, incorporating clutch and kick-starter. Since the frames are, as we said before, practically interchangeable, the same excellent features obtaining in the four-stroke are incorporated, such as wide mudguards, the improved form of down tube, and the capacious tank. The lubrication is by pump and sight feed, leading directly to the crank case.

EDMUND, No. 99.

2¾ h.p. four-stroke MODEL: 70×76 mm. (292 c.c.); side-by-side valves; M-L chain-driven magneto; Amac carburetter; Enfield or Burman two-speed gear; chain drive; 26×2¼in. Dunlop tyres.

CHAS. EDMUND AND CO., LTD., Crane Bank, Chester.—Messrs. Edmund and Co. will be remembered to be one of the earliest who attacked the problem of rear springing, and, although their device does not actually spring the rear portion of the motor cycle, the rider is most delightfully insulated from all shocks on long leaf springs. The saddle tube passes through the down tube of the frame, in which it slides, and to which the aluminium footboards are attached and sprung in unison with the saddle. There are two models of this machine exhibited, one being fitted with a J.A.P. four-stroke engine, the other with a 2¾ h.p. Union two-stroke. The four-stroke models are fitted with the Enfield double chain selective two-speed gear, enclosed in a very neat cast aluminium case. The top tube of the frame is hinged at the steering head, and also moves with the saddle, thus giving a most rigid effect to the springing device. The petrol tank, which is of the pannier type, one compartment being each side of the main frame tube, is attached to this tube, and is also sprung, the petrol connection to the carburetter being by flexible petrol-proof tubing. The springing is readily adjustable to any weight of rider by merely turning an adjusting nut on the back spring carrier stays, on which are fitted rebound springs.

2¾ h.p. two-stroke MODEL: 70×76 mm. (292 c.c.); M-L direct-driven magneto; Amac carburetter; spring suspension; Burman two-speed gear; chain drive; 26×2¼in. Dunlop tyres.

The two-stroke model is identical with the four-stroke, but has a Burman two-speed gear with kick starter, the magneto on this model being directly coupled with the crankshaft on the engine. Six machines are shown. These are all finished in black, and have a neat and pleasing appearance.

ROYAL RUBY, No. 101.

8 h.p. V twin four-stroke MODEL: J.A.P.; 85.5×85 mm. (976 c.c.); side-by-side valves; Amac carburetter; chain-driven magneto; three-speed Sturmey-Archer gear; chain drive; Dunlop 28×3in. tyres.

RUBY CYCLE CO., LTD., Cannel Street, Ancoats, Manchester.—A very fine display of the two models of the Royal Ruby machine is to be seen on this stand, there being three sidecar outfits and six lightweights. Probably the chief point of interest in the sidecar machine is the substantial and original arrangement of springing. In this model the carrier is sprung with the frame. A single laminated spring is used both back and front, and in each case it is supported on roller bearings, which dispense with the necessity of shackles. Quickly detachable

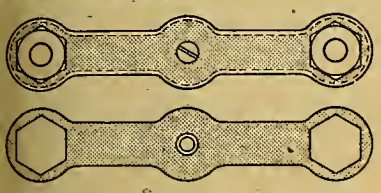
The Olympia Show.—

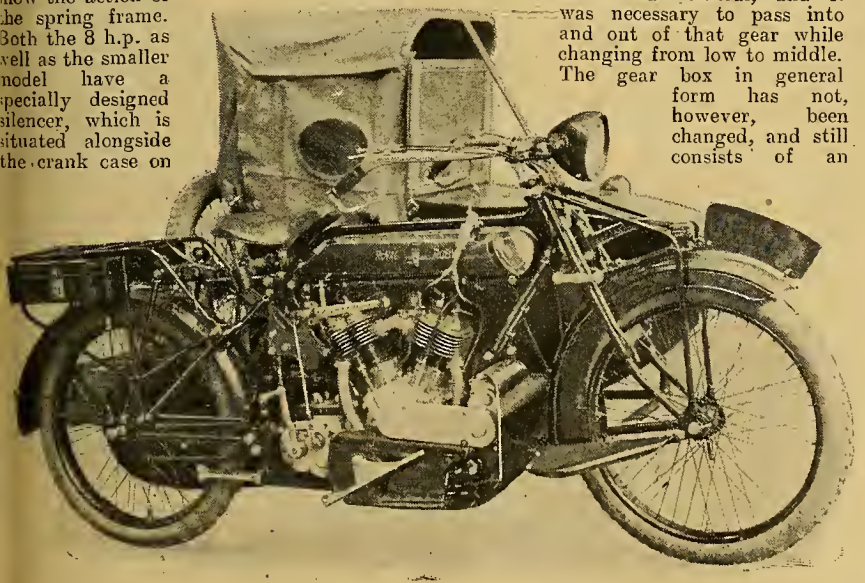


Locking plates which prevent the slacking of the spindle nuts are fitted on the spring fork links of the 3 h.p. Royal Ruby.

nd interchangeable wheels are also a oteworthy feature. The adjustable foot-oards will interest many riders who find he standard position of certain machines ncomfortable. The rear wheel brake is nother new feature. It is of the internal xpanding type, and is situated at the ide of the hub. The sidecar is very oomy, and is undoubtedly most comfort-ble. A novel feature is the method of pringing the body, which, in conjunction vith the spring wheel, gives luxurious iding, and at the same time considerable ateral stability. The whole outfit gives he impression of great strength. The inish is good, and the red and black namel of the tank gives a smart ppearance.

3 h.p single four-stroke MODEL: 74.5×80 mm. (349 c.c.); side-by-side valves; Amac carburetter; Thomson - Bennett chain - driven magneto; spring frame; two-speed countershaft gear; chain and belt drive; Dunlop 26×2½in. tyres.

The lightweight model is a most distinctive machine, and also includes the ear and front springing system as fitted o the larger machines. The carrier, however, on the lightweight is not sprung. The whole machine, including the engine, s of Royal Ruby manufacture. A tripped model of this type is shown with he spring tension slacked off, so as to how the action of he spring frame. Both the 8 h.p. as well as the smaller model have a pecially designed silencer, which is situated alongside the crank case on the right-hand side, and both models have a neat undershield, which also covers in the silencer. A sensible fitting on both types is the locking device for the front fork shackled nuts.

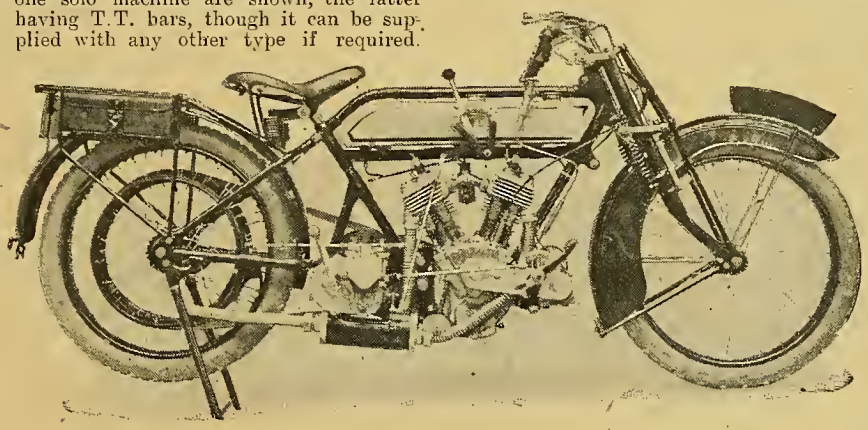


A very complete passenger machine is the 8 h.p. spring frame Royal Ruby sidecar outfit illustrated Detachable wheels are used.

HAZLEWOOD, No. 107.

5 h.p. V twin four-stroke MODEL: J.A.P.; 70×85 mm. (654 c.c.); side-by-side valves; B. and B. carburetter; M-L chain-driven magneto; three-speed gear; chain and belt drive; Dunlop 650×65 mm. tyres.

HAZLEWOODS, LTD., West Orchard, Coventry.—Two sidecar combinations and one solo machine are shown, the latter having T.T. bars, though it can be supplied with any other type if required.



Specimen of the 5-6 h.p. Hazlewood-Jap, three-speed, solo and sidecar mount.

The machines are identical as regards engine, gear box, and transmission, and the frame of the solo mount has the same integral lugs for sidecar attachment. An improvement for 1920 lies in the gear box, which now provides a straight run through from first to second and from second to third, the neutral notch on the quadrant being between first and second. Formerly the high gear notch was central, and it was necessary to pass into and out of that gear while changing from low to middle. The gear box in general form has not, however, been changed, and still consists of an aluminium case bolted to and suspended from the lower steel member of a triangulated portion of the frame. The kick starter gear is unusually substantial, and is completely enclosed within the gear box itself, the ratchet faced pinion being mounted at one end of the main shaft. The rear brake, pedal operated, is particularly worthy of note. It consists of a drum, secured to the right-hand side of the rear wheel, to which is applied an exterior fabric-lined shoe 7in. in length. Accessible right and left-hand threaded adjustment is provided, and also a stop against which the shoe is held when out of action by a spring taking effect at its opposite end. A point worthy of commendation is the additional support afforded to the uppermost front tube of the sidecar attachments. In addition to passing through one of the integral lugs, the tube carries alongside the head an S-shaped oval plate, which is anchored at the top to a bolt passing through the top head lug. By this means the head of the machine is relieved from a large proportion of the torsional stresses set up by the sidecar, the tube itself is given additional support, and what in practice amounts to a bearing some 9in. in length is provided for this point of attachment.

CORONA JUNIOR, No. 32.

4 h.p. single-cylinder four-stroke MODEL: 72×110 mm. (488 c.c.); staggered valves; Amac carburetter; E.I.C. chain-driven magneto; single gear; belt drive; Dunlop 26×2½in. tyres.

METEOR MANUFACTURING CO., LTD., 98, Tollington Park, N.4.—The Corona is fitted with an engine that has several very novel features. The crank case and cylinder are cast in one piece. One side of the crank case is entirely detachable, so that the crankshaft can be easily removed. The cylinder head is separate, so that decarbonisation is possible, while the engine is still in the frame. The cylinder head, it may be mentioned, is made of special alloy to give efficient radiation. The crank case is made of a one-piece stamping of nickel steel, and the cylinder is set slightly *désaxé* in order to reduce the wear and side stresses on the cylinder wall. The crankshaft runs on

The Olympia Show.—

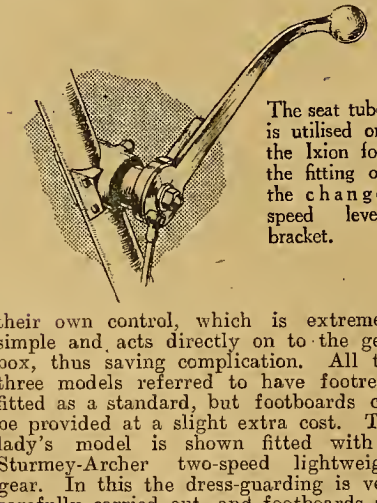
large size ball bearings, and inside flywheels have been avoided in the design. The arrangement of the valves is particularly interesting. These are staggered, and so situated that the stems incline to a common centre, meeting at the axis of the camshaft. This position simplifies the timing gear, and does away with any necessity for rocker arms; consequently there are only two gear wheels in the timing gear case. The valves are enclosed and have adjustable tappets. Within the magneto chain case is a small sprocket which drives the lubricating pump. This pump delivers oil from a sump on the outside of the crank into a trough in the base chamber into which the connecting rod dips. The connecting rod has split bearings, and the piston is provided with two rings. The models shown are of the single gear variety, but the company is at present engaged in manufacturing suitable gear boxes of the two and three-speed types. The rear wheel is provided with two internal expanding brakes, and the springing of the front forks is rather out of the common. The front wheel is mounted on two bell crank levers, and is suspended on an ingenious coil spring system.

IXION, No. 22.

2½ h.p. single-cylinder two-stroke MODEL: 70×70 mm. (269 c.c.); Amac carburetter; chain-driven magneto; two-speed gear; chain-cum-belt drive; 26×2in. Dunlop tyres.

IXION MOTOR MANUFACTURING CO., LTD., 35, Great Tindal Street, Ladywood, Birmingham.—This firm's exhibits consist of seven machines, including four distinct types. The engines are the same size in every case, the chief difference being in the nature and manner of the equipment.

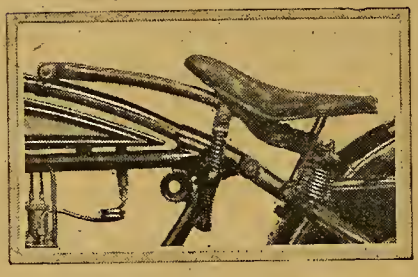
There is one single gear model, in which belt drive is employed; two two-speed models, one of which is fitted with the Burman two-speed gear box, and the other with the Sturmey-Archer two-speed lightweight gear box. In the case of the Burman fitted model, the Ixion Motor Mannfacturing Co. have provided



The seat tube is utilised on the Ixion for the fitting of the change speed lever bracket.

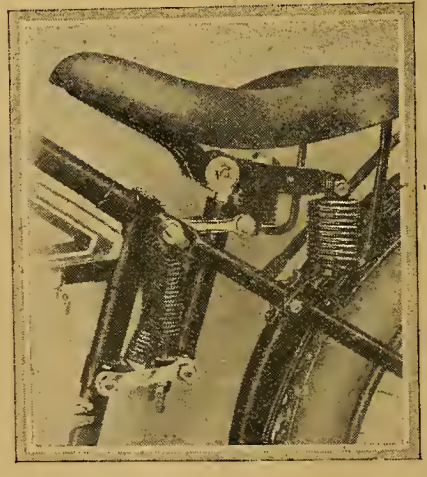
their own control, which is extremely simple and acts directly on to the gear box, thus saving complication. All the three models referred to have footrests fitted as a standard, but footboards can be provided at a slight extra cost. The lady's model is shown fitted with a Sturmey-Archer two-speed lightweight gear. In this the dress-guarding is very carefully carried out, and footboards are fitted as a standard. In these types lubrication is by Best and Lloyd drip feed.

SPRING SADDLE PILLARS—THE BEST ALTERNATIVE TO A SPRING FRAME.



Spring saddle-pillars are growing more popular. The Rex cantilever seat was introduced many years ago, and is still fitted in improved form.

Great simplicity and easy application to a standard motor cycle frame characterise the Chater-Lea spring seat-pillar.

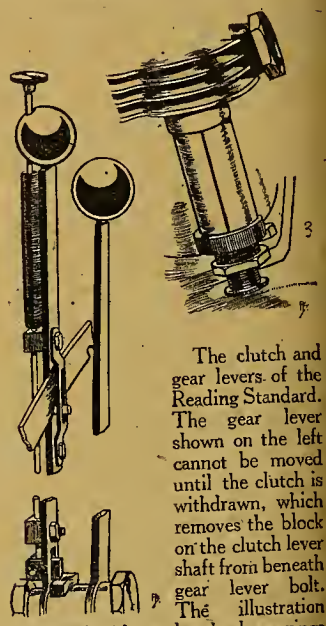


The Ariel is one of the many machines in which the saddle-pillar is spring supported.

READING STANDARD, Nos. 11(and 195.

10 h.p. V twin four-stroke MODEL 85.7×101.6 mm. (1,170 c.c.); side by-side valves; Schebler carbu retter; Bosch or Berling magneto three-speed sliding gear; chai drive; 28×3in. tyres.

STANLEY J. WATSON, 37, Sheen Road Richmond, S.W.—The Reading Standar will be remembered as an America motor bicycle which has always closel adhered to English ideals whilst still re



The clutch and gear levers of the Reading Standard. The gear lever shown on the left cannot be moved until the clutch is withdrawn, which removes the block on the clutch lever shaft from beneath gear lever bolt. The illustration above depicts the enclosed valve springs and tappets on the Reading Standard.

taining several desirable Americ characteristics, such as the single-lev carburetter, high power, and sound co struction. The valves are situat side-by-side, and their springs are neat enclosed in telescopic protectors. Spec attention has been paid to the mater of the valves, which are of chro vanadium steel, and are guaranteed n to warp or become pitted. Roller be ing connecting rods are fitted. The ge box is also worthy of mention, in th it contains three speeds, is of su stantial construction, and the shafts r on ball bearings throughout. Lubric tion is effected by means of a skew-driv mechanical oil pump, which maintai a constant level of oil in the cra chamber, and by an auxiliary hand pum The transmission is by ⅞in. wide by ⅜ pitch roller chains. The mudguards wide and carefully valanced. Li many other American motor cycles, possesses a spring seat-pillar in additi to a comfortable saddle. This pil consists of a movable rod in the sad tube carried between two heavy sprin one taking the load and the other che ing the rebound, while it also posses the advantage of being adjustable so to suit the rider's weight. The mo bicycle shown is fitted with a Splitd electrical generator carried entir separate from the magneto and driv by belt off the mainshaft.

The Olympia Show.—

SALTLEY, No. 148.

2¾ h.p. Villiers two-stroke MODEL: 70×70 mm. (269 c.c.); Amac carburetter; C.A.V. chain-driven magneto; two-speed Albion gear; chain and belt drive; Dunlop heavy tyres.

SALTLEY CYCLE Co., 86, Snow Hill, Birmingham.—A neat two-stroke lightweight, the Saltley is shown on the stand of Timperley and Co. in the Gallery. The machine is manufactured on standard lines, and a sporting layout is followed. The Villiers engine is fitted, and lubrication is effected by direct drip to the crank case through a Best and Lloyd sight feed oil pump. T.T. bars and disc wheels are fitted as standard, and aluminium footboards, with a neat heel brake pedal on the left, are provided. The Albion gear box, with or without clutch and kick-starter, is fitted, and single-speed models are also offered.

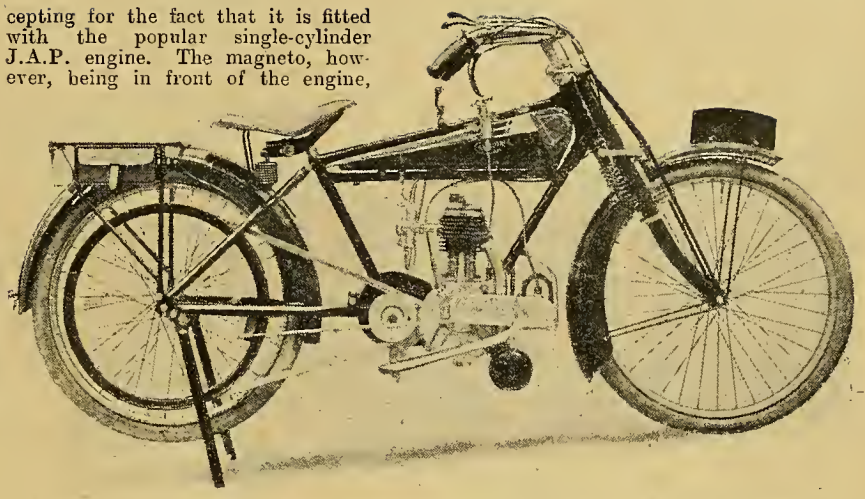
CALTHORPE, No. 84.

2¾ h.p. two-stroke MODEL: 75×79 mm. (350 c.c.); valveless gear; Amac carburetter; C.A.V. chain-driven magneto; chain and belt drive; two-speed selective clutch gear; 26×2in. Dunlop tyres.

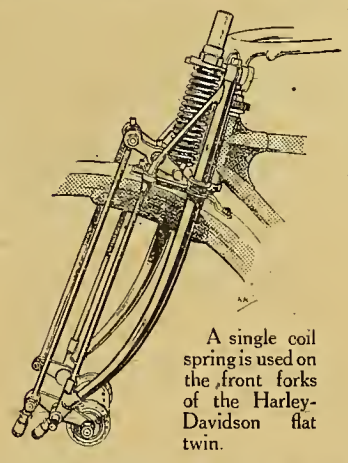
CALTHORPE MOTOR CYCLE Co., Barn Street, Birmingham.—Two models, each of which is subject to slight variations, are exhibited on the Calthorpe stand. The two-stroke is fitted with an engine following accepted practice and having a detachable plate covering the transfer port. Lubrication is by sight feed drip to a groove surrounding the cylinder, from which oil passes to the piston and finally to the crank case. The gear fitted is an Enfield with final belt transmission. Front springing is effected through Druid type forks with spring top links. Both front and rear guards are partly valanced, and the rear wheel brake acts on the inside of the belt rim. A very practical feature of one example is the neat all-black finish.

2¾ h.p. single four-stroke MODEL: J.A.P.; 70×76 mm. (292 c.c.); side-by-side valves; Amac carburetter; C.A.V. chain-driven magneto; chain and belt drive; two-speed selective clutch gear; Dunlop 26×2in. tyres.

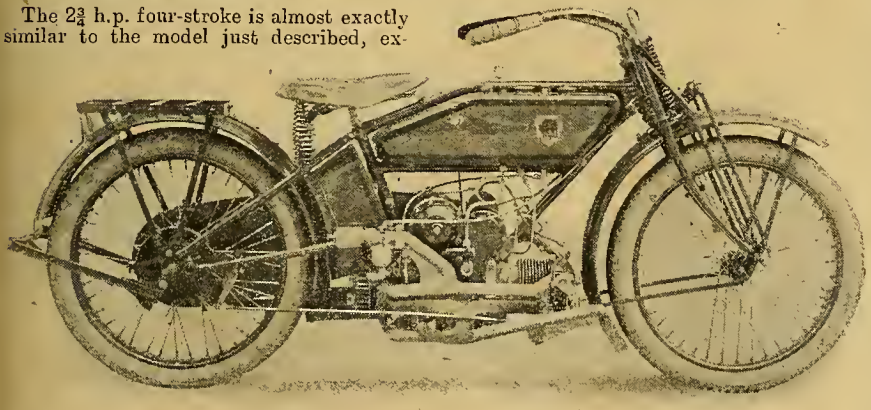
The 2¾ h.p. four-stroke is almost exactly similar to the model just described, except for the fact that it is fitted with the popular single-cylinder J.A.P. engine. The magneto, however, being in front of the engine, is protected by a simple aluminium shield. All Calthorpe models are distinguished by the striking octagonal tank and sloping top tube. Black or plated finish of either type is optional. The chains in both models are protected by a wide guard.



A Calthorpe, with J.A.P. engine and Enfield gear. One of the several lightweights offered by the Calthorpe Co.



A single coil spring is used on the front forks of the Harley-Davidson flat twin.



An American flat-twin—the 4 h.p. Harley-Davidson, a machine that already has good records to its credit in the U.S.A.

HARLEY-DAVIDSON, No. 117.

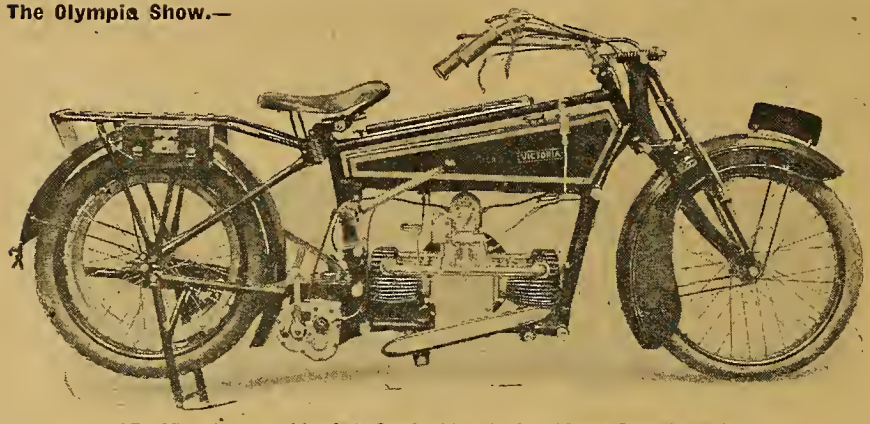
7-9 h.p. V twin four-stroke MODEL: 84×89 mm. (986 c.c.); overhead inlet valves; Schebler carburetter; Berling gear-driven magneto; three-speed gear; chain drive; Goodyear 28×3in. tyres.

HARLEY-DAVIDSON MOTOR Co., LTD., 74, Newman Street, W.—The Harley-Davidson Motor Co. have an imposing exhibit of three sidecar outfits and three solo motor cycles. These include the electrical and magneto models, as well as the handy little flat twin Sports model, which is bound to be popular among motor cyclists during the coming year. There is a certain fascination about the heavy solo of big horse-power which appeals to a vast number of riders, and it is in the design of this type of machine that the American manufacturers have excelled. Also the same type gives ample reserve of power when attached to a sidecar, and the sidecar models on this stand will receive special attention in our sidecar article in next week's issue. The 7-9 h.p. Harley-Davidson possesses many excellent points. Among these may be mentioned the spring seat-pillar, having the spring enclosed in the saddle tube, and the spring forks, the springs of which are just as neatly hidden inside the fork members. So far as the engine is concerned, it may be mentioned that of the two connecting rods the main runs on roller bearings. The lock nut of the valve tappets is of very ingenious design: it permits very fine adjustment, and when once locked is quite secure.

4 h.p. flat twin four-stroke MODEL: 70×76 mm. (584 c.c.); side-by-side valves; Schebler carburetter; gear-driven magneto; three-speed gear; gear and chain drive; 26×2½in. tyres.

The Sports model will certainly appeal to the rider who wants a mediumweight mount for solo riding which will give a fair turn of speed. It is full of interesting features, such as the staggered valves actuated by one camshaft, the ingeniously heated induction pipe, and the simple form of single chain transmission. Roller bearings are fitted throughout, including

The Olympia Show.—



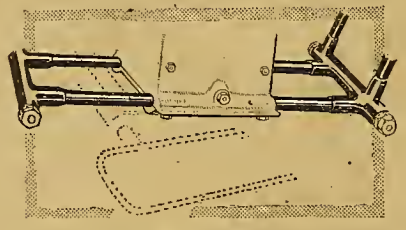
The Victoria motor bicycle is fitted with a 5-7 h p. Victor flat twin engine.

the crank pin bearings, and large balance counterweights are fitted to the crankshaft. The question of cooling has been carefully gone into, even the valve caps possessing radiating fins. The valve guides are screwed into the cylinders, thus allowing easy replacement.

VICTORIA, No. 87.

5-7 h.p. flat twin four-stroke MODEL: Victor; 75×78 mm. (688 c.c.); Amac carburetter; C.A.V. gear-driven magneto; Sturmey-Archer three-speed countershaft gear; chain drive; Dunlop 650×65 mm. tyres.

VICTORIA MOTOR AND CYCLE CO., LTD., Dennistoun, Glasgow.—The most striking



Method of mounting the Victor engine on the duplex tubes of the Victoria motor bicycle.

exhibit on the stand of the Victoria Motor and Cycle Co. is the Victor-engined flat twin model. The machine is novel in many respects and should prove a fast solo mount and a sturdy example of a sidecar machine. The framework is duplicated below the tank, and the engine rests on two parallel tubes. A special framework supports these tubes from a T lug and the base of the saddle tube. Throughout the whole framework the massive proportions are particularly noticeable, as also is the fact that locknuts are used wherever necessary. Brampton Biflex forks provide front springing. The front mudguard is fully valanced, and the rear guard is of exceptional width. The chain from the engine to the Sturmey-Archer gear box is protected by a sheet metal cover, and wide rubber-covered footboards are provided for the rider. Lubrication is by sight feed drip, and a very large torpedo-shaped silencer is attached to the chain stays.

O.K., No. 86.

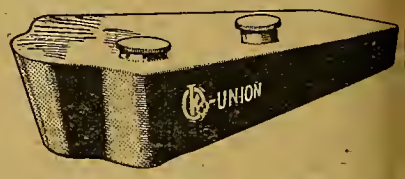
2¾ h.p. single-cylinder two-stroke Union MODEL: 70×76 mm. (292 c.c.); Amac carburetter; Runbaken magneto, direct driven; single speed; belt drive; 26×2in. tyres.

HUMPHRIES AND DAWES, LTD., Hall Green Works, Birmingham.—A large amount of attention has been attracted to the new O.K. Union by the plucky ride which was undertaken by Capt. P. Pike from Inverness to Land's End. The machine, which is to sell at the moderate price of 38 guineas, is to be mass produced, and will undoubtedly attract a large number of prospective purchasers, owing to its sound construction. The Union two-stroke engine forms the power unit, and it will be remembered that one of the most outstanding features is the magneto driven direct from the crankshaft. The lubrication is by sight feed drip directly to both main crankshaft bearings, plain bearings being used throughout. An auxiliary lead from the main oil pipe feeds directly to the piston. Large diameter bearings and a drilled connecting rod with split big ends are employed, and the one-piece crankshaft has disc webs carefully balanced. Special provision is made to prevent oil leakage from the bearings. With regard to the construction of the frame and details, the broad outlines are pleasing, and the all-black finish is most practical. The O.K. leaf spring fork is extremely simple, and should provide great comfort, while a metal tool box is carried on the top tube, where it receives less vibration from road shocks than on any other part of a motor cycle.

A Union engine in section is also shown on this stand.

2¾ h.p. flat twin four-stroke MODEL: 60×60 mm. (348 c.c.); overhead inlet valves; Amac carburetter; C.A.V. magneto, chain driven; two-speed gear; chain-cum-belt drive; 26×2¼in. tyres.

Another model which will be exhibited to the public for the first time is the flat twin O.K. This is an interesting little machine in many respects, especially as regards the valve gear. As indicated in the heading, the inlet valve is directly over the exhaust, but a feature which is well worthy of notice is the fact that the valves are operated by a single cam, which is driven through internally cut gearing. This is perhaps the simplest form of valve



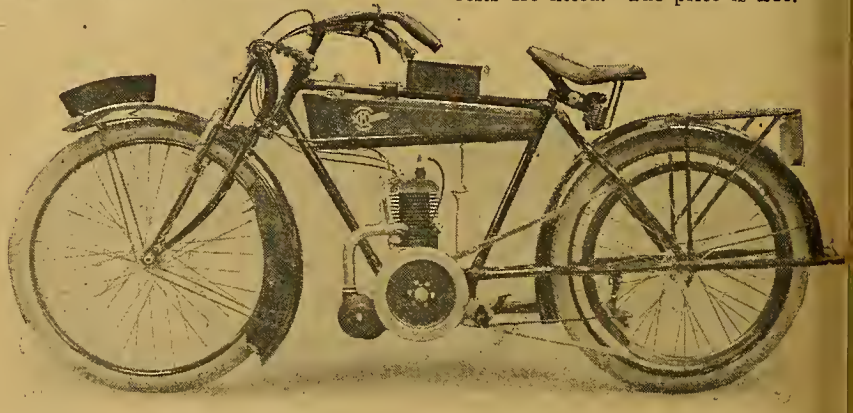
The shapely tank of the new O.K. union, which Humphries and Dawes are introducing to sell at a popular price.

gear possible for a flat twin. The frame is of duplex construction, and is both strong and light. Forks similar to those described on the O.K. Union, but of a slightly heavier type, are fitted.

KINGSBURY, No. 1.

2¾ h.p. two-stroke MODEL: 75×79 mm. (349 c.c.); Senspray carburetter; chain-driven magneto; belt drive; 26×2¼in. tyres.

LONDON AND MIDLAND MOTORS, LTD., 445, Oxford Street, W.1.—A new lightweight, manufactured by the Kingsbury scooter firm, is one of the chief exhibits staged by London and Midland Motors, Ltd. It follows conventional lines, but as regards design and general specification, it has a straight tube frame, Brampton forks, Xl-All saddle, and plain mudguards. Two pairs of rubber-faced footrests are fitted. The price is £50.



The 2¾ h.p. O.K. Union single-geared mount, one of the cheapest machines in the Show.

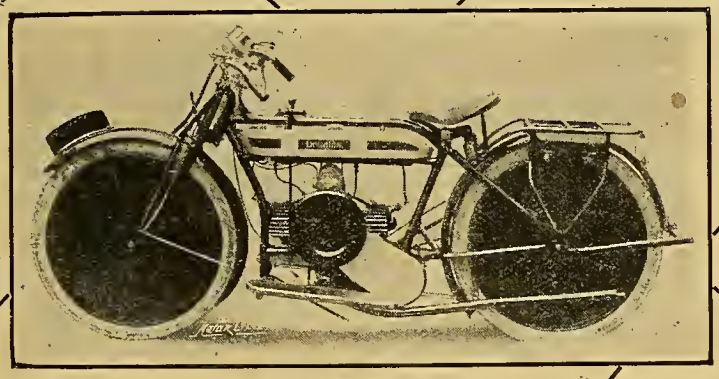
LEVIS & N.U.T.



ASK FOR OUR REPRESENTATIVE AT THE SHOW.

April 25, 1919

Messrs Vivian Hardie and Lane, Ltd.

Dear Sirs,

I must thank you for your attention. I first saw your name in "The Motor Cycle," it is a blessing to discover a firm which takes a real personal interest and treats their customers on the good old English lines of courtesy promptness, and consideration.

Yours faithfully

(Signed) H. C. S—

Oct. 22, 1919.

Dear Sirs,

I feel I must write and thank you for such prompt attention, especially so taking into account the small amount of my purchase, i.e. 6d. Needless to say I shall not fail to place any further orders for spare parts, &c., when I require prompt attention.

Yours faithfully

(Signed) H. L. C—

The Olympia Show.—

SIMPLEX, No. 36.

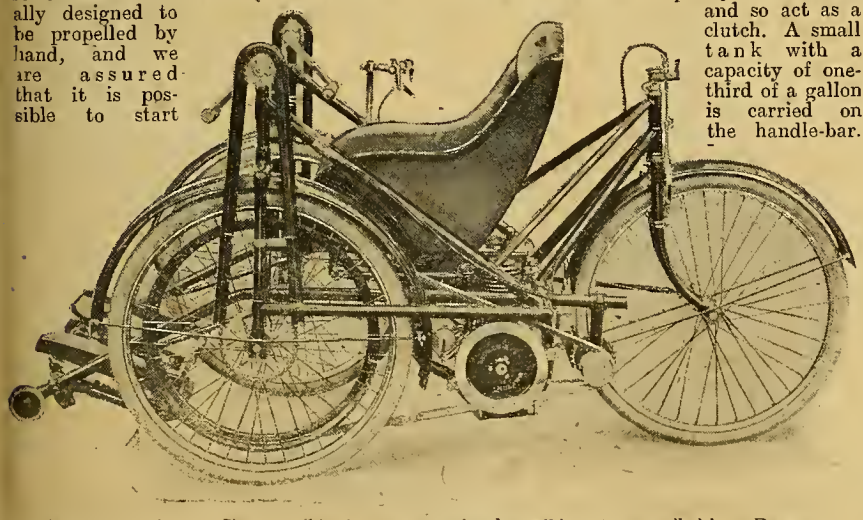
1 h.p. two-stroke MODEL: 51×51 mm. (105 c.c.); Amac carburetter; Runbaken magneto; gear driven; chain drive.

PATRICK ENGINEERING CO., LTD., New Summer Street, Birmingham.—The Simplex is one of the earliest attachments for motorising a pedal cycle. The unit, we may remind our readers, is fixed by means of a hinged clip on to the seat-pillar tube, and there are two supporting stays from the engine base to the cycle wheel spindle. The driving wheel is attached by special tubular spokes, through each of which wire passes through small holes pierced in the rims between the ordinary spokes. The engine is a two-stroke, and drives by gear to a countershaft on which a small chain wheel is fitted. There is a tiny plate clutch which enables a free engine position to be obtained.

DAYTON MOTOR TRICYCLE, No. 40.

1½ h.p. two-stroke MODEL: Amac carburetter; Lion chain-driven magneto; adjustable pulley; belt and chain drive; 26×1¾ Warwick tyres.

CHAS. DAY MFG. CO., LTD., 221, High Street, Shoreditch, London, E.1.—This is a motor-propelled invalid tricycle of a type about which we are often asked by those who have been unfortunate enough to have been seriously disabled while fighting for their country. The motive power is a Dayton two-stroke engine carried in an under-frame. The drive is by chain to a countershaft, and thence by belt to the near side wheel. Everything is of the simplest. There is a tank holding one gallon of petrol and one pint of oil, on which there is a pump for introducing the oil into the petrol as the petroil system of lubrication is employed. The small pulley is adjustable, so that the gear ratio may be altered. A short tiller is provided for the steering, which moves the back wheel through a rack and pinion. On this tiller is a brake lever, and one actuating the compression release. Adjacent to the left hand is the carburetter control. The tricycle was originally designed to be propelled by hand, and we are assured that it is possible to start the engine with one hand. The speed attainable is from three to twelve miles an hour.

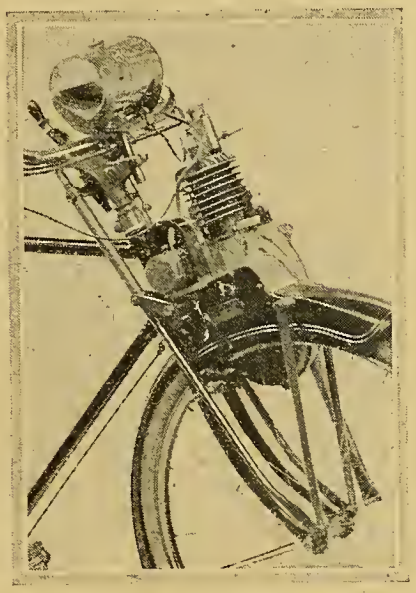


Among a variety of Show exhibits is a motor-assisted invalid chair, propelled by a Dayton two-stroke engine

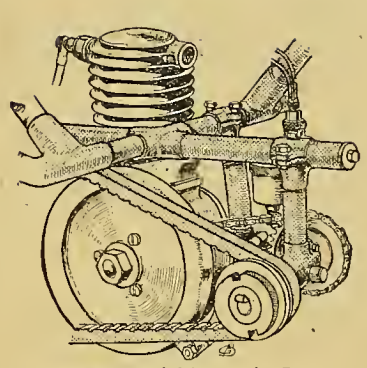
CYCLO-MOTOR, No. 200.

1½ h.p. four-stroke single-cylinder MODEL: 50×55 mm. (105 c.c.); friction transmission.

THE BRITISH MOTOR CAB CO., LTD., Grosvenor Road, S.W.1.—The auxiliary motor attachment is represented at Olympia by designs from England, U.S.A., and France. The latter production is known as the Cyclo-Motor, and is on view at Messrs. Smith's stand in the Gallery. Of the four-stroke type, the engine is carried on a pair of special forks intended to replace the existing forks of a pedal cycle. Transmission is by friction wheel on the tyre of the bicycle wheel, and a lever is arranged to enable the friction pulley to be raised and so act as a clutch. A small tank with a capacity of one-third of a gallon is carried on the handle-bar.



A French auxiliary motor unit, the 1½ h.p. cyclomotor which drives a pedal cycle front wheel by friction roller on the tyre.



Arrangement of drive on the Dayton invalid tricycle.

YOUNG, Nos. 114 and 227.

1¾ h.p. single-cylinder two-stroke MODEL: 70×70 mm. (269 c.c.); Amac carburetter; Runbaken chain-driven magneto; chain transmission.

MOHAWK CYCLE CO., LTD., Hornsey, N.—Having an engine of slightly larger horse-power than those usually fitted to pedal cycle motor attachments, the Young engine and transmission set should appeal specially to heavy riders or those who live in hilly districts. Conventional three-port practice is followed in the engine design, excepting that the transfer port is covered with a plate fixed by screws, and that a detachable head is fitted. The engine is mounted on a frame or carrier which fits on the seat stays, and has two additional struts extending to the axle. A further stay of flat steel, having a yoke or bridging piece in it to accommodate a small countershaft, is fitted between the engine and the hub spindle. The cylinder extends rearwardly and horizontally, the flywheel is to the right of the machine, and the magneto is between the crank case and the rear of the cycle saddle. Transmission is by chain. The first reduction is to a large sprocket on the countershaft beforementioned, and in this is situated a handle-bar controlled metal cone clutch. From here the drive is taken to the back hub, on which a chain sprocket is screwed on the side remote from the pedalling free-wheel. The makers hope to market this attachment at a reasonable price, probably in the region of £20.

The A.C.U. and Olympia.

The Auto Cycle Union are at Stand No. 2, where members will receive every attention at the hands of a large staff. Special facilities are provided whereby prospective members may enrol without any of the formalities which are unavoidable when writing. The Senior and Junior Tourist Trophies and other famous challenge cups are on view. A number of road guides are distributed throughout the building and its immediate vicinity to give a helping hand to all and sundry. Members will doubtless avail themselves of the lounge—provided by the Union in the well-known Princes Rooms—where special arrangements have been made for the provision of tea and light refreshments.

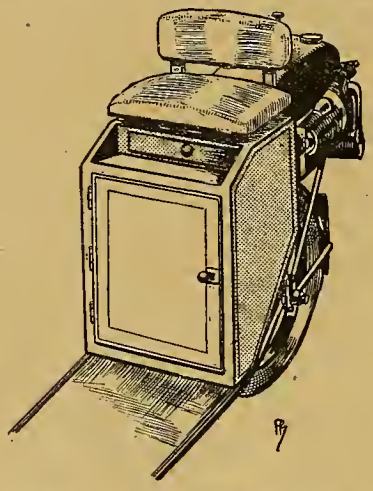
NOVELTIES IN SCOOTER DESIGN.

Examples of Miniature Two-wheelers Exhibited at Olympia.

SKOOTAMOTA, No. 41.

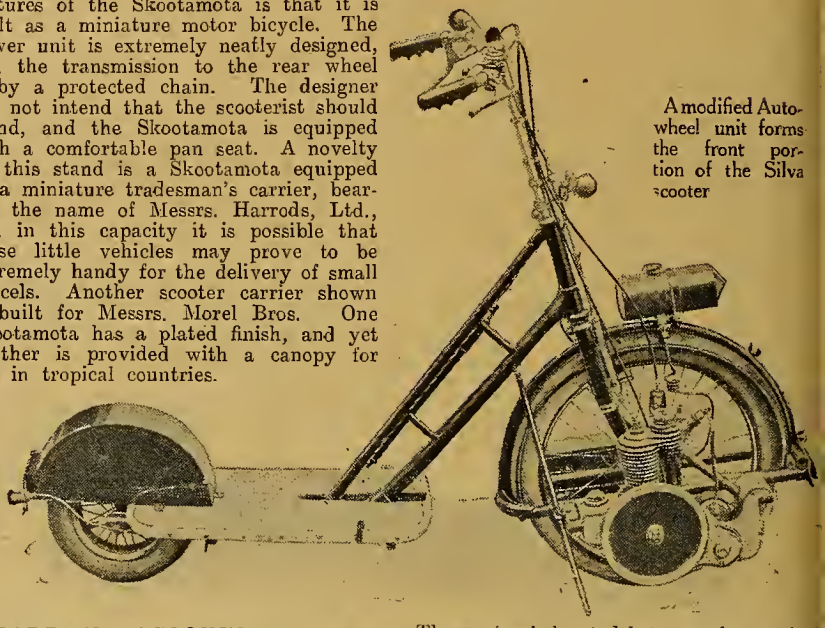
1½ h.p. four-stroke MODEL: 60×44 mm. (125 c.c.); overhead exhaust valve; Amac carburetter; C.A.V. magneto, gear driven; single gear; chain drive; 16×2⅜in. Clincher tyres

GILBERT CAMPLING, LTD., 1, Albemarle Street, W.1.—Designed by Mr. Granville Bradshaw, the Skootamota is full of ingenious points. It is interesting to note that its cylinder forms half the unit of the neat little flat-twin stationary engine



A large box is fitted beneath the seat on the commercial model A.B.C. Skootamota.

which Mr. Bradshaw designed for electrical generating sets and blowers for filling airships during the war. Following the original A.B.C. practice, the exhaust valve is situated in the cylinder head, which is detachable, and the inlet valve beneath it, while the cylinder is of steel, and is turned from the solid. One of the features of the Skootamota is that it is built as a miniature motor bicycle. The power unit is extremely neatly designed, and the transmission to the rear wheel is by a protected chain. The designer did not intend that the scooterist should stand, and the Skootamota is equipped with a comfortable pan seat. A novelty on this stand is a Skootamota equipped as a miniature tradesman's carrier, bearing the name of Messrs. Harrods, Ltd., and in this capacity it is possible that these little vehicles may prove to be extremely handy for the delivery of small parcels. Another scooter carrier shown is built for Messrs. Morel Bros. One Skootamota has a plated finish, and yet another is provided with a canopy for use in tropical countries.

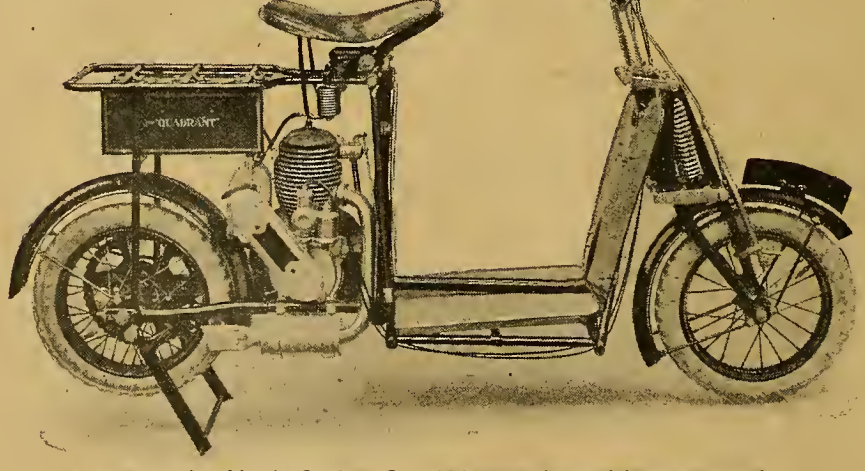


A modified Auto-wheel unit forms the front portion of the Silva scooter

QUADRANT SCOOTER, No. 121.

2 h.p. single two-stroke MODEL: 70×76 mm. (292 c.c.); Amac carburetter; M L chain-driven magneto; single speed; chain drive; 16×2½in. Wood-Milne tyres.

QUADRANT CYCLE CO., LTD., 45, Lawley Street, Birmingham.—This is quite a new product, and has every appearance of being a practical type of machine, with refinements not usually associated with motor scooters. Except for the small diameter wheels, it may well be considered a lightweight motor cycle, the weight being 110 lb. Spring forks, a sprung platform, and adjustable height handle-bars and seat-pillar are in evidence, and a front wheel rim brake.



A scooter produced by the Quadrant Co., which approaches a miniature motor cycle.

The engine is located between the vertical saddle tube and the rear wheel, and is surmounted by a rectangular tubular frame, which displaces rear stays, serves to support the one and a half gallon petroil tank, and forms a substantial luggage carrier. The rear wheel stand has, like the larger Quadrants, a spring clip mounted on a lug extending from the back fork on the left, thus relieving the mudguard of the duty of supporting the stand.

SILVA, No. 17.

1 h.p. single four-stroke MODEL: 52.5×54 mm. (117 c.c.); automatic — inlet valve; S.U. single-lever carburetter; C.A.V. gear-driven magneto; single speed; chain drive; Avon 20×1¾in. tyre on front and Palmer Cord 300×60 mm. tyre on rear wheel.

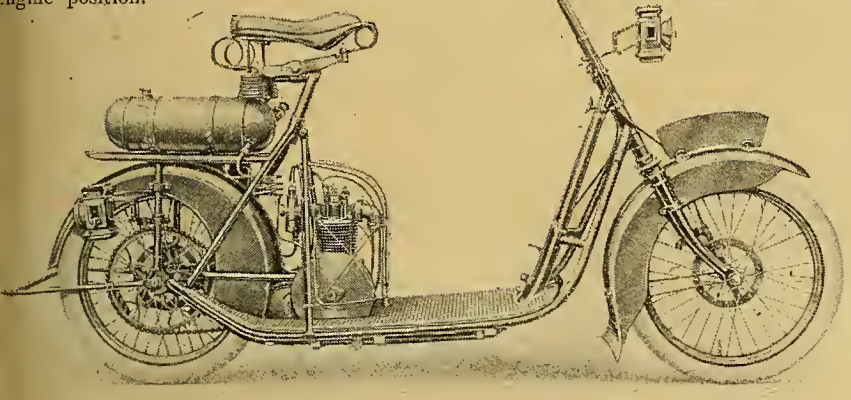
T. AND T. MOTORS, LTD., 52a, Conduit Street, W.1.—On this stand is to be seen the Silva scooter, the motive power of which is an Auto-wheel unit suitably placed in the forks. The rear wheel is considerably smaller than the front, and is fitted with a 300×60 mm. Palmer Cord tyre, while the front wheel is equipped with an Avon 20×1¾in. tyre. The rider is intended to assume a standing position on this scooter, but a seat may be fitted at a slight extra cost. On the opposite side of the power unit is a small box designed to carry an accumulator for lighting and a few tools. The Silva scooter is fitted with a simple form of single leg stand.

AUTOPED SCOOTER, No. 28.

W.T.T. ENGINEERING CO., LTD., 6-10, Dalling Road, Hammersmith, London, W.1.—There is shown on this stand the Autoped scooter. This machine is of very ingenious construction and

The Olympia Show.—

embodies twist grip controls, clutch, and flywheel magneto. The construction of the frame is most ingenious and well worth a careful study. The steering pillar when depressed provides a free engine position.



A feature of particular interest on the Whippet scooter is the aluminium cylinder. Overhead valves are used on the engine.

KINGSBURY, No. 1.

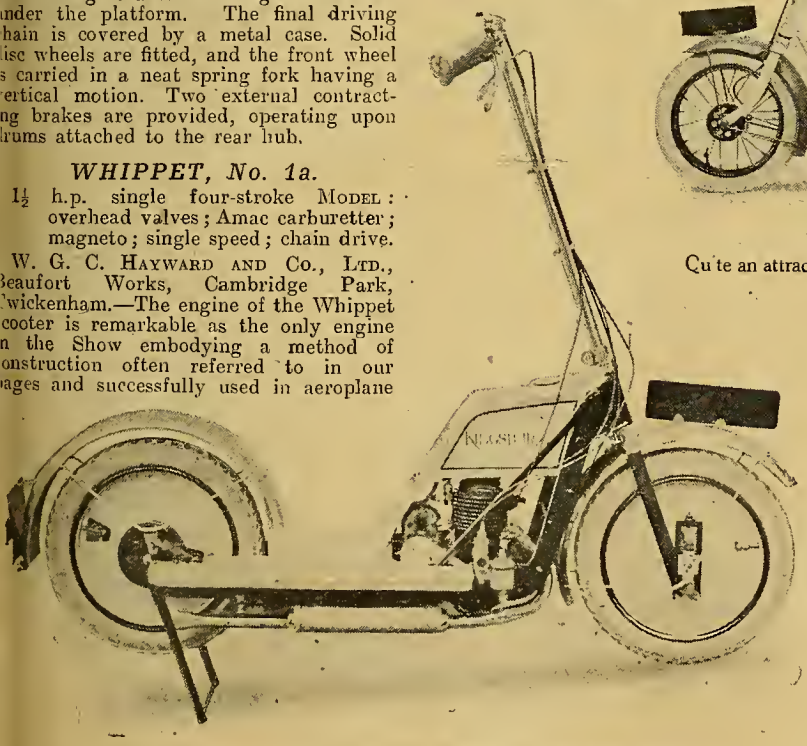
2¼ h.p. two-stroke MODEL: Amac carburetter; C.A.V. magneto; chain-driven; chain transmission; single speed.

LONDON AND MIDLAND MOTORS, LTD., 145, Oxford Street, S.W.1.—A substantially built scooter, embodying a pressed steel frame and large platform. The Kingsbury is one of the best of the "stand up to ride" types. The engine is located in the front end of the "chassis," and has a detachable head, the cylinder barrel and crank case forming one casting. Chains are used for the transmission, the primary drive being to a ball bearing countershaft under the platform. The final driving chain is covered by a metal case. Solid disc wheels are fitted, and the front wheel is carried in a neat spring fork having a vertical motion. Two external contracting brakes are provided, operating upon drums attached to the rear hub.

WHIPPET, No. 1a.

1½ h.p. single four-stroke MODEL: overhead valves; Amac carburetter; magneto; single speed; chain drive.

W. G. C. HAYWARD AND CO., LTD., Beaufort Works, Cambridge Park, Twickenham.—The engine of the Whippet scooter is remarkable as the only engine in the Show embodying a method of construction often referred to in our pages and successfully used in aeroplane practice, viz., an aluminium cylinder with a steel liner and a detachable head. The engine is a 1½ h.p. four-stroke, and is situated almost below the saddle, the supporting tubes of which divide and pass on each side of it. The pistons are also of aluminium. The petrol tank is unusually large for a scooter and contains 1¼ gallons of petrol as well as oil. The upper half of the rear wheel is enclosed, and both wheels are fitted with contracting band brakes, that in front being operated from the handle-bar by a Bowden cable, and that in the rear by a pedal.

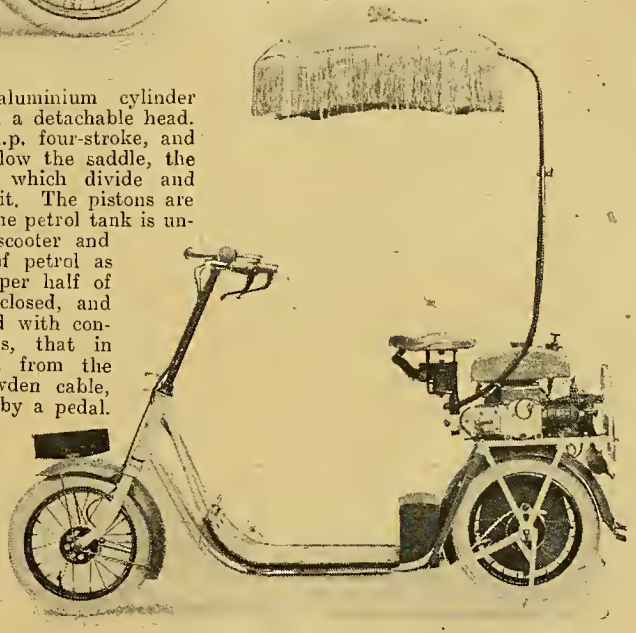


The Kingsbury scooter, which has a two-stroke engine and disc wheels.

LONDON-EXETER RUN.

Up to 21st of November fifty-one entries had been received for this sporting event—a large number of them from new members joining specially for the winter run. Members are reminded that entries close on December 8th. Owing to the fact that it has been found impossible to arrange for a meal at the Bridge House Hotel, Staines, competitors must make their own arrangements before the start. Meals have been arranged for at the White Hart at Salisbury on both outward and homeward journeys, and breakfast at the Bude Hotel, Exeter. Hot refreshments will also be obtainable at Yeovil.

The hon. sec., Mr. B. Alan Hill, "Apsley," Fellows Road, Farnborough, Hants, would be glad to hear from any motor cyclists who would be willing to help along the route as marshals, etc.



WHAT NEXT IN SCOOTERS?
Quite an attraction at the Show is the Oriental model Skootamota, which has a silk canopy, as shown.

The T.T. Races in 1920.

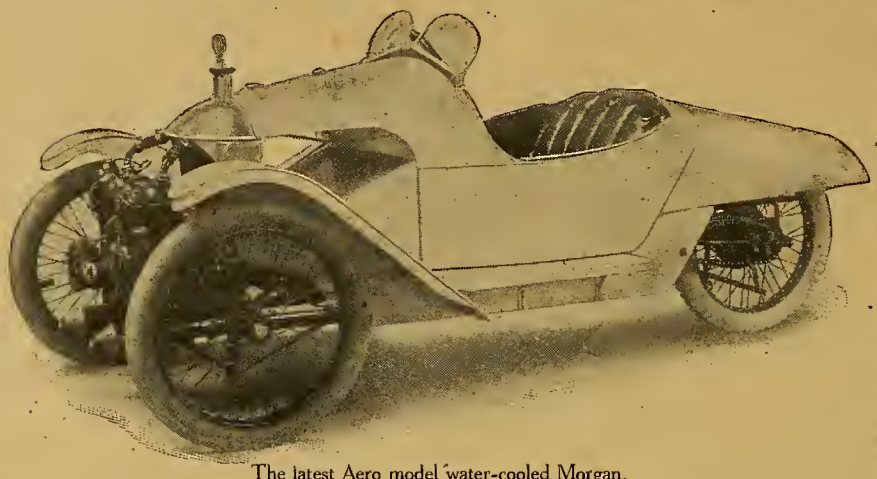
We hear that the Manx people are looking forward to the renewal of the T.T. races in 1920, and the R.A.C. has received a hearty invitation to organise races. The A.C.U. has provisionally arranged the programme, which will include a lightweight race for the trophy presented by *The Motor Cycle*, to take place in May next.

"THE MOTOR CYCLE" SHOW REPORT.

This issue creates a new world's record in the circulation of motoring journals, the printing order being for over 130,000 copies. Apart from circulation, however, there are actually more pages than in any previous issue, the weight of paper alone exceeding 70 tons. There are approximately 300 illustrations.

THE RUNABOUTS AT OLYMPIA.

Latest Examples of Three-wheeled Passenger Motor Cycles available in 1920. Definite Progress Achieved.

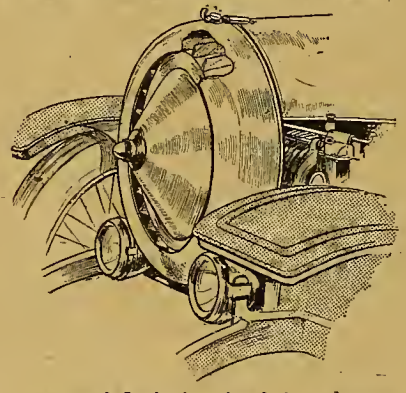


The latest Aero model water-cooled Morgan.

MORGAN, No. 120.

8 h.p. V twin MODEL: 85.5×85 mm. (976 c.c.); side-by-side valves; Amac carburetter; gear-driven magneto; two-speed gear; chain transmission; 700×80 mm. tyres.

MORGAN MOTOR CO., LTD., Malvern.—In addition to a chassis, eight complete machines are shown. These comprise two standard air-cooled models, one with an 8 h.p. J.A.P. engine, and the other with a 10 h.p. Precision (85×96 mm. V twin); two with a type of body termed the Aero model, and having water-cooled 10 h.p. J.A.P. (85.5×85 mm.) and M.A.G. (82×104 mm.) engines respectively; two *de luxe* machines, one with an air-cooled J.A.P. engine, and the other with a water-cooled motor of the same make; while the last two consist of a 10 h.p. M.A.G.-engined standard Grand Prix water-cooled model, and a 10 h.p. water-cooled J.A.P.-engined four-seater. The latter is shown for the first time in public, and is primarily intended for two adults in front and two children behind.



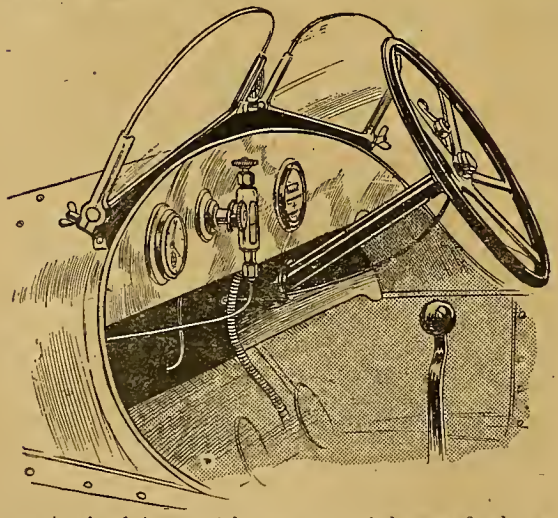
A vaned flywheel enclosed in a dummy radiator provides a forced cooling draught for the cylinders of the Wooler mule.

The front seat is adjustable for length of leg, and can be brought well forward if, on emergency, two normally-proportioned adults were to be carried behind, though obviously this little machine could not be expected to cope with a regular load of, say, 40 stones. The back seat, nevertheless, is quite as roomy as that at the front, and is well upholstered; it will certainly accommodate two well-grown children even if a week-end suit case or parcels were carried between them. The general design of the Aero body model is particularly attractive, for the streamline tail harmonises well with the fore part of the machine. The dashboard is aluminium faced, and carries a speedometer and clock flush fitted, besides the sight feed oiler in the centre. The Grand Prix type is well known as a wonderful hill-climber and exceptionally speedy for a motor vehicle of this weight and type; it is capable of a speed of over 60 m.p.h. on the level. Various detail improvements have been embodied in all types for 1920; for instance, the tail is now hinged so that, after two holding-down springs have been released, it can be lifted instantly for tyre repairs, inspecting, or adjusting the chain. The withdrawal mechanism of the clutch, too, is now provided with a ball thrust race, considerably reducing wear at this point and facilitating change of gear. But in general design there has been found no call for variation.

WOOLER MULE, No. 47.

10 h.p. flat twin MODEL: 85×90 mm. (1,022 c.c.); single valve and distributer valve; Wick carburetter; C.A.V. gear-driven magneto; variable pulley; belt and shaft drive; 700×75 mm. Palmer cord tyres.

WOOLER ENGINEERING CO., LTD. Alperton.—One of the most novel passenger machines staged at Olympia is the



A pair of Auster triplex aero type windscreens fitted to a Grand Prix Morgan. Observe the aluminium instrument board.

The Wooler-Mule, a three-wheeler embodying many unconventional features in the engine, transmission, and springing system.

Humber

At Olympia

The 4½ h.p. Humber Motor Cycle exhibited at Olympia has a flat twin cylinder engine, as in the 3½ h.p. model, but it should create a greater demand, because it is constructed for sidecar work as well as solo, whereas the 3½ h.p., though it did splendid service for riders with combination attached, was generally recognised as a "solo machine."

Stand No. 85.

There is ample margin of power reserve in sidecar work with the 4½ h.p. 1920 Humber. The engine, 75 bore, 68 stroke, has horizontally-opposed cylinders, perfect balance, and smooth, easy-running qualities.

The model is staged at Olympia, both as solo and with attractive and comfortably-sprung sidecar.

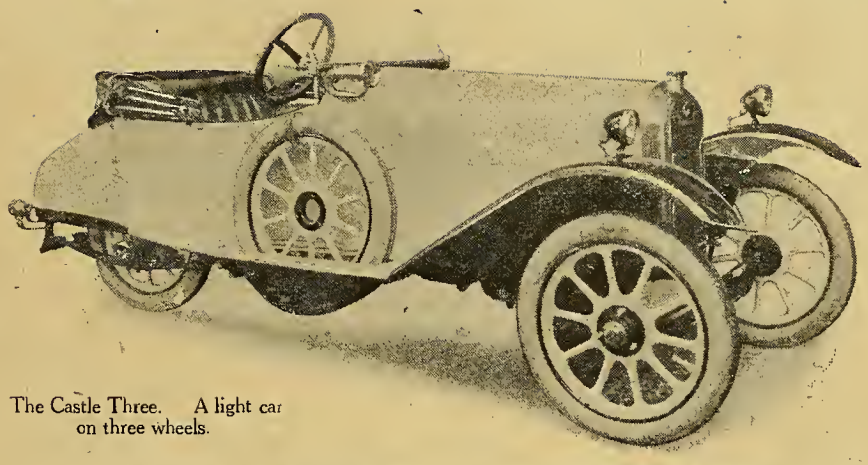
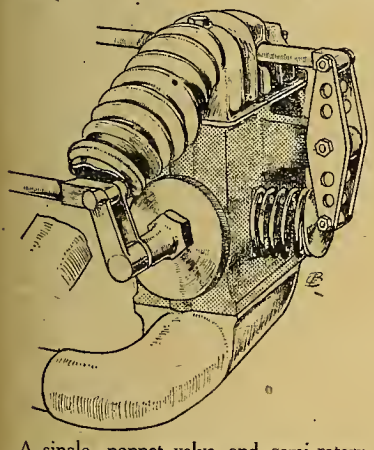
CYCLE TYRE DEPT., 103, St. John St., Clerkenwell, E.C.

The Olympia Show.—



The Castle Three. A light car on three wheels.

new Wooler Mule. Beginning with the engine, this is full of interesting features. First, the heads of the horizontal cylinders are detachable, and held in position by a ring fixed by long holding-down bolts. The valve gear consists of a single poppet valve, which remains open from the beginning of the exhaust stroke to the end of the inlet stroke, its functions being determined by a semi-rotary valve operated from a separate camshaft. As the engine is placed across the frame, the cylinder heads protrude from the bonnet, and, in addition to being exposed to the air, they are cooled by a simple arrangement of forced draught. A conical web of the flywheel projects from a circular dummy radiator, and on the periphery of the flywheel rim fan vanes are disposed. These force air over the cylinders, and by means of baffles the airflow is directed on to the cylinder heads. The transmission is particularly ingenious. Gear ratios, varying from 4½ to 17¼ are obtained, and the drive first passes through two enclosed Whittle belts.



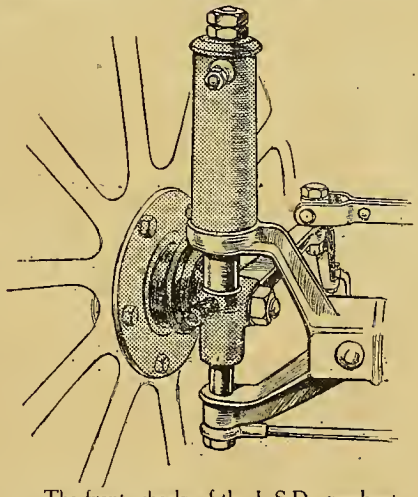
A single poppet valve and semi-rotary distributing valve are used on the Wooler Mule.

From the belts the drive is taken through a horizontally jointed propeller-shaft to a worm gear in the back axle, there being two rear wheels placed close together. It should here be stated that all four wheels are interchangeable. A simple armoured wood girder chassis is employed. Steering is by worm and wheel, and the springing of both front and back wheels is similar to that of the Wooler motor cycle, that is to say, by coil springs enclosed in guides, the wheels being free to move vertically. Both brakes act on the rear wheels, one being of the contracting band type and the other of the expanding shoe type. The body at present fitted will be somewhat increased in size in the future. Altogether, this machine is a striking novelty, and will be further dealt with at a later date. Light weight and a moderate price (£185) are further features.

CASTLE, No. 37.

10 h.p. four-cylinder MODEL: 64×85 mm. (1,094 c.c.); side-by-side valves; Zenith carburetter; spiral gear-driven magneto; two-speed and reverse epicyclic gear; shaft drive; 710×85 mm. tyres.

CASTLE MOTOR CO., LTD., New Road, Kidderminster. — An elaborate three-wheeler built entirely on car lines. The motive power is a four-cylinder Dorman water-cooled engine, driving through a clutch and two-speed epicyclic gear, and thence by propeller-shaft to a universal joint, from which the power is transmitted by a short shaft, very slightly out of line with the first shaft, and by bevel gear to the rear wheel. The latter is detachable by means of a withdrawable spindle and without disturbing the brake drum. There are two brakes, that operated by hand acting on a drum running in oil in the gear box, while the foot brake is of the internal expanding pattern on the rear wheel. The steering is carried out through planetary reduction gear, and the column is adjustable. The chassis is composed of channel steel members. The three-wheeler is sold complete with hood, screen, and dynamo lighting set, and the whole machine is a car in miniature. The suspension is by short quarter-elliptic springs in front and semi-elliptic springs at the rear.

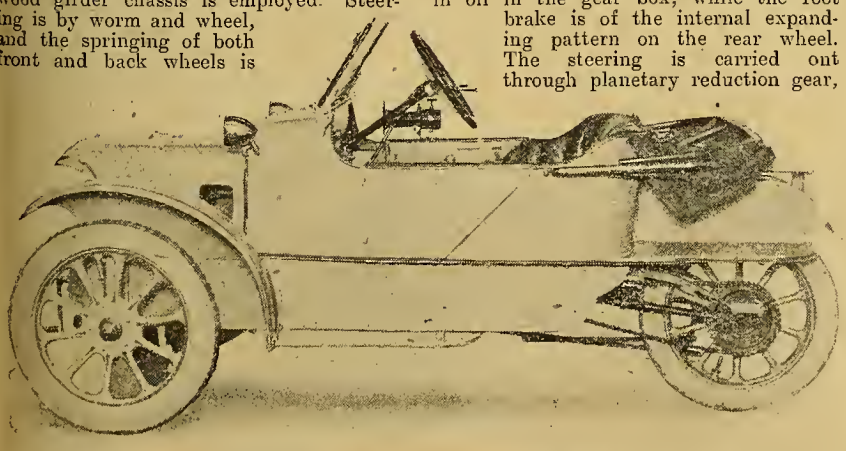


The front wheels of the L.S.D. runabout are suspended on enclosed coil springs

L.S.D., No. 38.

8 h.p. V twin four-stroke MODEL: J.A.P.; 85.5×85 mm. (976 c.c.); side-by-side valves; Amac carburetter; M-L gear-driven magneto; two forward speeds and reverse; shaft and chain drive; Dunlop 700×80 mm. tyres.

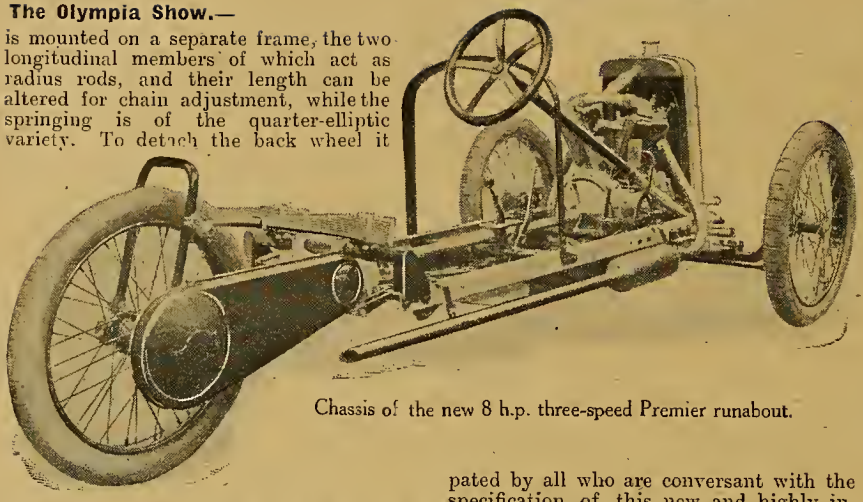
SYKES AND SUGDEN, LTD., Spring Place Works, Huddersfield.—Two three-wheeled cycle cars are exhibited, one complete and one partially finished. The J.A.P. engine conveys the power by means of a leather-to-metal cone clutch through a shaft to the two-speed gear box, which is of the firm's own manufacture. It contains a reverse actuated by a separate lever in the centre of the vehicle, adjacent to the driver's left hand. The change speed lever is on the right, and when the reverse lever is in operation the forward gears are automatically locked. The main longitudinal members of the frame are of ash. The back portion of the frame is of angle iron on ash. The rear wheel



Broadside of the L.S.D. three-wheeled runabout, which has Sankey steel detachable wheels.

The Olympia Show.—

is mounted on a separate frame, the two longitudinal members of which act as radius rods, and their length can be altered for chain adjustment, while the springing is of the quarter-elliptic variety. To detach the back wheel it



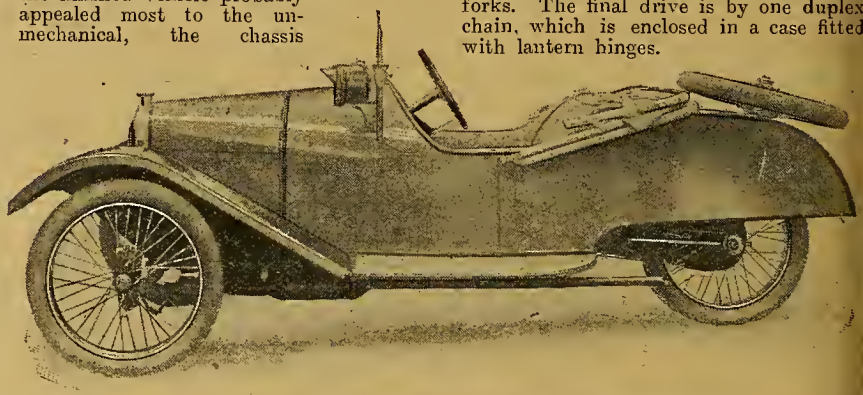
Chassis of the new 8 h.p. three-speed Premier runabout.

is necessary to withdraw the back spindle after first uncoupling the two side-by-side band brakes. The front portion of the chassis is mounted on enclosed coil springs; the steering is direct, and the steering wheel is of large dimensions. A roomy body is fitted with doors at each side, and provision is made for a third seat. An outstanding feature of the vehicle is its admirable accessibility.

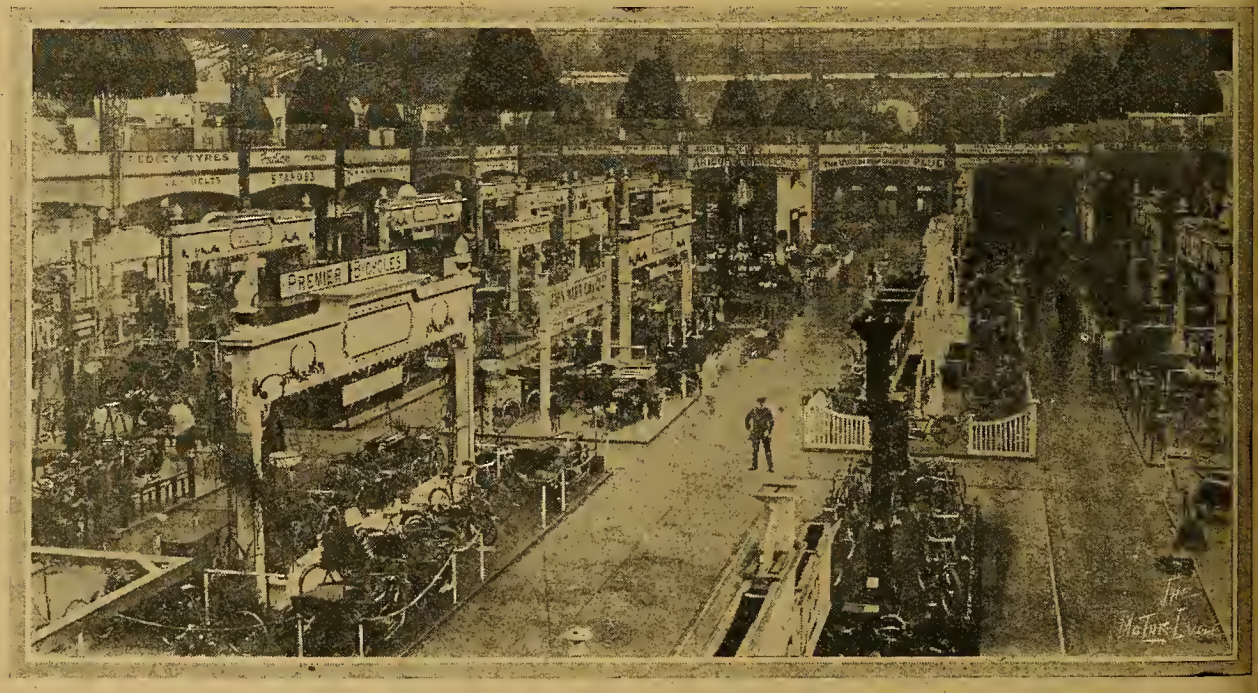
COVENTRY PREMIER, No. 62.

8-10 h.p. twin MODEL: 80×105 mm. (1,055 c.c.); side-by-side valves; Atmos carburetter, gear-driven magneto; three-speed and reverse gear box; shaft and single chain transmission; 700×80 mm. tyres.

COVENTRY PREMIER, LTD., Read Street, Coventry.—The complete runabout and a chassis exhibited by the Premier Co. are attracting the full share of attention on the part of the public that was anticipated by all who are conversant with the specification of this new and highly interesting three-wheeler proposition. While the finished vehicle probably appealed most to the unmechanical, the chassis made a strong appeal to those who pay closer attention to the mechanical elements. The whole design is extremely neat, and does not convey an impression of being a light car on three wheels, although at several points car practice has been followed. The frame has pressed steel side members, tapering at the front, and fitted with short quarter-elliptic springs to a drop front axle of tubular construction. The cross members are tubular, and support at the front end a small sub-frame, upon which is carried the engine and clutch unit. At the rear of the frame the tubular cross member is raised above the line of the frame by two substantial lugs. Upon this superstructure are fixed the two large quarter-elliptic rear springs, which are inclined slightly to miss the transmission. From the engine unit the transmission is by shaft to a three-speed and reverse gear box, which is also supported on the rear cross member in such a manner that the centre of the chain sprocket coincides with the pivotal point of the back wheel forks. The final drive is by one duplex chain, which is enclosed in a case fitted with lantern hinges.



The two-seater 8 h.p. Premier Runabout staged at Olympia



The Motor Cycle Show at Olympia, 9 a.m. Monday, all dressed up and—waiting for the visitors who arrived in their thousands an hour later, and a crowded house is the rule.

A VOYAGE ROUND THE GALLERY.

Things to see Amongst the Accessories. A Motor Cyclist's Tour of Inspection.

CONFINED to his apartment by force of circumstances, Xavier le Maistre created a work of lasting literary fame, which he called "A Voyage Round my Room." If a book could be written around the impressions of one's own room, how impossible it seems to compress within one short article even the merest details of a glimpse at the assembled accessories and equipment on the Gallery at Olympia!

Next week *The Motor Cycle* will refer in more detail to sidecars, accessories, and tyres, but our present purpose is to take a passing glance at the fittings and "gadgets" while our *confrères* deal with the motor cycles, glittering on the stands, which take pride of place in this issue.

Leaving the crowded ground floor for the no less crowded region upstairs, one finds an array of minor components and equipment in a variety which at once dazzles and gratifies the confirmed accessory fiend, to which class of rider the writer must confess to a decided bias.

The Electrical Equipment

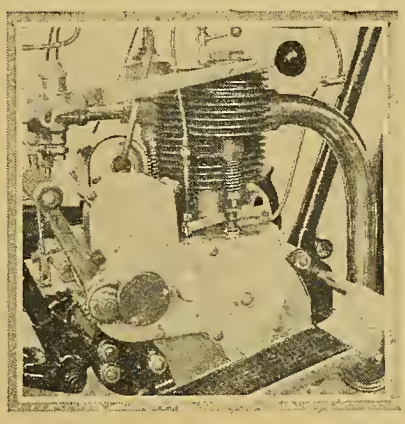
He who is interested in the latest tendency towards electrifying the motor cycle should at once make for the stands of Lucas, Powell and Hanmer, M-L, and Smith. These show respectively the Magdyno, combining a separate dynamo and magneto in one machine, and driven by one chain; the P. and H. dynamo set; the M-L lighting and ignition unit, which both lights the lamps and ignites the charge off the current from the one generator; and, finally, the Smith dynamo outfit, a neat instrument shown fitted on to an 8 h.p. Blackburne and sidecar.

Incidentally, one may light one's cigarette from a high-tension spark on the M-L stand before passing on.

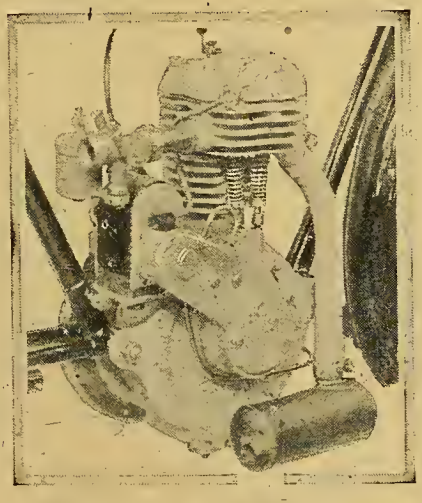
A majority of the exhibits are of trade interest, consisting of component parts which will assist the assembler, and tools to equip the workshop of the repair man. In this class are the stands of such firms as Brown Bros., Ltd., where the trade man may order anything from a split pin to a lathe. There are many other stands with a like variety displayed.

Motor cyclists who do their own repairs, and in consequence delight in convenient tools, will see innumerable labour-saving devices on Lake and Elliot's stand, such as valve truers, gudgeon pin removers, and similar tools; while they may look with longing at the splendid samples of adjustable spanners on the Abingdon and Lucas stands, and of tube spanners of the Apollo brand shown by Accles and Pollock, Ltd.

Riders who have booked a machine and expect a favourable delivery will find in the Gallery all the accessories which their taste and inclination will ever lead them to desire. Mechanical horns, speedometers, and distance recorders are here in profusion shown by Smiths, Cowey, Markt, and others. The Cowey mechanical horn is of a quite unusual pattern, and, finished in aluminium, looks exceedingly attractive. Lighting sets of all types—electrics, shown by Hunts, P. and H., and Lucas, and acetylene outfits by Millers, in addition to the two last-named, are to be seen and compared.



The new combined engine and gear unit of the latest big single Quadrant.



A new comer to four-stroke singles—The Corona

Before completing one's tour of the Gallery, special notice should be made of some of the effective methods of displaying the nature of the exhibitors' business. Thus a gargantuan sparking plug, with Sphinxes at the base, forming a group somewhat like Cleopatra's Needle on the Embankment, at once indicates a sparking plug which we all know to be excellent and enduring.

The Crackle of Lively Sparks.

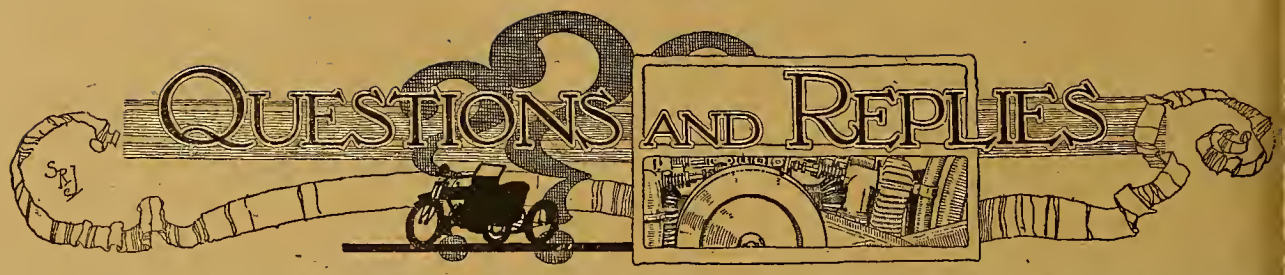
The M-L and Lucas people naturally run their magneto-dynamo machines so that we may see the light and the spark, while at such stands as C.A.V., E.I.C., Lodge, and Xl-All, we must expect to raise our voices to be heard above the crackle of lively sparks which demonstrate the efficiency of the respective magnetos and sparking plugs.

Mechanically-minded people who are a little hazy on the operation of an epicyclic gear will see a working model with pinions as big as soup-plates, this being an excellent indication of the nature of the Sturmey-Archer products.

Before departing we take a glance at the Lamplugh throttle-controlled mechanical oil pump, of which a working model is fitted on to a small J.A.P. engine. Best and Lloyd also show a device of a similar nature. We then pass on to notice the B. and B. and Amac automatic carburetters, pausing awhile to examine the beautiful samples of war material which recently occupied the makers of the Senspray carburetter.

With an admiring look at all the things we cannot mention for lack of space, we will bid the reader *adieu*, directing him downstairs to the refreshment room, while we recommence our voyage, calling at every port, in order to make the complete report of the accessory and tyre exhibits, which will appear in detail in next week's issue.

In the Diamond models the tubes of the newly designed frames closely follow a correct diamond formation



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Lady Motor Cyclists.

I should be grateful if you would tell me whether the A.C.U. has any lady members.—A CHESHIRE LADY MOTORIST.

The A.C.U. has many ladies amongst its members. Your other questions will be dealt with by post if you will comply with our regulations and send a stamped and addressed envelope.

Removing Belt Drum.

Will you inform me how to remove the belt driving wheel, which is fixed to the hub of the 1915 4¼ h.p. B.S.A. motor cycle?—FIXED.

The belt pulley on the rear wheel of the 1915 B.S.A. motor cycle is screwed on with a left-hand thread (the lock ring is right-hand thread. These pulleys are extremly difficut to remove, and, unless you have special apparatus, they are easily damaged in the process. We would recommend you to return the wheel to the makers if it is necessary that the pulley should be taken off.

Starting Difficulties.

I am troubled by difficult starting from cold on my 4¼ h.p. B.S.A. Can you give me any useful suggestions?—J.J.H.B. (Sierra Leone).

We should have imagined that in your climate starting the engine even from cold would be fairly easy. We would suggest the following points in order to make the starting easier. Open the adjustable jet on the B.S.A. carburetter one complete turn, advance the ignition almost fully, and place the gear lever in the third speed, release the exhaust valve, when the foot starter pedal is almost at the bottom of its stroke.

Reboring Cylinders.

I am thinking of having the cylinders of my 3½ h.p. Douglas rebored and fitted with new pistons. Will you inform me what is the least amount of metal one can leave with safety? Surely the thinner the walls the better the cooling would be. Can you recommend reboring?—C.F.L.

If it is necessary to rebore the cylinders of your Douglas, we should suggest that you approach the makers, who would perform the work far more satisfactorily than most smaller firms. If the ovality of the cylinders necessitates removal of more than $\frac{5}{1000}$, we should advise you to have them renewed.

Timing A.I.V. Engine.

Will you please help me in the following: An old type Minerva engine under bottom tube, battery and coil ignition, about 2 h.p. Please say how to time same (automatic inlet). Also, the plug appears at times to spark not at the points but some distance higher up. What is the fault, if any?—I.S.P.

Timing as follows: Inlet—Automatic. Exhaust—Valve closes when the piston reaches top dead centre. Ignition—Set control two-thirds retard; spark to occur with the piston on top dead centre (compression stroke). Plug is apparently shorting across the insulation. A new one is advisable.

Overtaking a Tramcar.

Will you kindly tell me which is the correct side on which to pass a tramcar both when running and stationary? I was told recently that it is correct to pass a stationary car on the near side, but as passengers are usually mounting or dismounting when the car stops it is more of a difficulty to pass on the near than the off side.—E.P.J.

In overtaking a tramcar a good deal of discretion has to be used, and there is no very definite legal ruling on the point. When a tramcar is in motion it is better, if at all possible, to overtake it in the ordinary way on the off side, but circumstances may compel you to keep on the near side. The same applies also when it is stationary.

Leakage from Gear Box.

I have a 1917 3½ h.p. Ariel sc. outfit. After running a few miles my belt becomes smothered with grease from the gear box. Last week I partly filled the gear box with grease before starting on a long journey, but on arriving at my destination the box was nearly empty. Please tell me how to stop this. What is the best means of cleaning the belt? Is petrol injurious? What grease do you recommend?—C.W.W.

The only thing to do is to have the gear box taken down and find the cause of the leak. It might be that the bearings require rebushing or that a felt washer is needed. All you can do is to wipe the belt with a rag soaked in petrol. Petrol naturally destroys rubber, but if it is wiped quickly and lightly no harm should ensue. Ambroleum or thick engine oil is generally used.

Unsuitable Magneto.

I have bought a 6 h.p. N.S.U and do not think that the magneto is the right one for it. The cylinders are set at 60°. If set No. 1 exhaust to close to dead centre, will the other come right? Contact breaker cams are set at 180° is this right? If not, can I alter them to suit the engine?—A.H.

(1.) If both valves are worked from one cam you need only time one valve, and if this is done properly the correct timing of the other will follow. (2.) If the magneto is one designed to suit an engine with cylinders set at 180°, it will be impossible to modify it to suit a 60° V twin engine; you would need another magneto suited to the latter angle. The cams should be set at 150°.

Timing Old Pattern Engine.

(1.) Will you please give me the correct timing of the exhaust valve of my old type Fafnir motor cycle? (2.) If this were wrong, would it cause overheating?—E.H.E.S.

(1.) The timing of the exhaust valve of your engine, which is presumably one with an automatic inlet valve, is as follows: Rotate the engine until the piston is at the top of the stroke, then insert the cam wheel so that the valve is just closing. (2.) If the exhaust valve timing is very much out it would cause poor running. Most probably the trouble is the result of late ignition timing or insufficient lift of the exhaust valve due to a worn cam or too much clearance between the tappet and the valve stem.

Ownership of Stolen Machine.

I bought a second-hand combination from a private individual, and obtained an authenticated stamped receipt for the purchase money. But the outfit happened to be a stolen one. Some days later the person from whom it was stolen identified the machine while I was riding it, and claimed it as his property. How do I stand in the matter? Have I to give up the machine and claim against the person from whom I bought it, or what should really happen?—A.C.R.

In the event of your unwittingly purchasing a stolen machine, the law would compel you to hand it over to the rightful owner. You can only claim against the person from whom you purchased the machine.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

DVERTISEMENTS in these columns rst 12 words or less 2/-, and 2d. for every tional word. Each paragraph is charged rately. Name and address must be counted. s discounts, conditions, and special terms gular trade advertisers will be quoted on ication.

stal Orders and Cheques sent in payment for rtisements should be made payable & Co. IFFE & SONS Ltd., and crossed sury Notes, being untraceable if lost in sit, should not be sent as remittances.

l advertisements in this section should be mpanied with remittance, and be addressed ie offices of "The Motor Cycle," Hertford t, Coventry. To ensure insertion letters ld be posted in time to reach the offices of e Motor Cycle," Coventry, or London (20, r St., E.C.4), by the first post on Friday ning previous to the day of issue.

l letters relating to advertisements should e the number which is printed at the end of advertisement, and the date of the issue hich it appeared.

ie proprietors are not responsible for clerical rinters' errors, although every care is taken void mistakes.

NUMBERED ADDRESSES.

the convenience of advertisers, letters may be ssed to numbers at "The Motor Cycle" Office. this is desired, the sum of 6d. to defray the cost of ration and to cover postage on replies must be added e advertisement charge, which must include the Box 000, c/o "The Motor Cycle." Only the number ppear in the advertisement. All replies should be ssed No. 000, c/o "Motor Cycle," 20, Tudor Street, .

Replies to Box Number advertisements containing ances should be sent by registered post, but in all such it is advisable to make use of the Deposit System.

he case of motor cycles offered for sale under a box er, as it is unusual for these to be sold without first lospected by the intending purchaser, advertisers will ate business by embodying in their advertisements mention of the district in which the machine d may be seen and tried.

DEPOSIT SYSTEM.

sons who hesitate to send money to unknown persons leal in perfect safety by availing themselves of our it System. If the money be deposited with "The Cycle," both parties are advised of this receipt. time allowed for a decision after receipt of the is three days, and if a sale is effected we remit the it to the seller, but, if not, we return the amount depositor, and each party to the transaction pays ge one way. For all transactions up to £10, a it fee of 1/- is charged; on transactions over £10 nder £50, the fee is 2/6; over £50 and under £75, 5/-; £75 and under £100, 7/6; and on all transactions £100, ½ %. All deposit matters are dealt with at idor Street, London, E.C.4, and cheques and money should be made payable to Iliffe & Sons Limited. letter "D" at the end of an advertisement is an tion that the advertiser is willing to avail himself of eposit System. Other advertisers may be equally us, but have not advised us to that effect.

SPECIAL NOTE.

eaders who reply to advertisements and receive no r to their enquiries are requested to regard the e as an indication that the goods advertised have ly been disposed of. Advertisers often receive so enquiries that it is quite impossible to reply to one by post.

MIDDLE

MIDDLETON'S, London, oldest established sidecar makers, note with pleasure the growing popularity of the sidecar, which they helped to create.

MIDDLETON'S note a number of new sidecars on the market. There's also a lot of new Bacon about since the war. Be careful.

MIDDLETON'S now ask Bacon and Box to oblige with song and dance to cheer up the Garrett-Cellar Sidecar Makers' Association.

MIDDLETON'S New Novel. Shall we forgive her, or was the sidecar to blame? Also Tips for Motor Cyclists: a remarkable work explaining how to get off, how to get on, how to stand up when oiled, why single men have twins, coppers all about them; illustrations showing abnormalities easily detected on the face of the scarce and remarkable copper who does not take a tip.

MIDDLETON.—Now ladies, gentlemen, and others, to business. We have three models for immediate delivery.

MIDDLETON'S Touring Coach Model, bulbous, with lockers under seat and at rear, sprung upholstery; £24, fitted free.

MIDDLETON'S Lightweight Coach, bulbous back, lockers, etc., same as touring model; £20, fitted free.

MIDDLETON Flier, the fastest sidecar in the world; £19. We are willing to pay a proportion of any fine for speed inflicted on a purchaser of this model, as we feel to blame for selling such a speedy sidecar to the general public. This offer holds good for three months after purchase.

MIDDLETON'S, the oldest established sidecar makers in London. Also repairs. Trade supplied.—27, Stroud Green Rd., N.4 (near Finsbury Park Tube Station). [1215

S

FOR

SANDUM, the Smart Sidecar Specialists.

STEVEN'S Engineering Co., 184-186, Pentonville Rd., King's Cross, London, N.1. [1211

The "IVY" TWO STROKE

We would make it better if we could.

We won't make it better because we can't.

The above few words sum up our whole policy. Every time and all the time we are out to produce a motor cycle of distinction, an aristocrat among its fellows, and we invite you to visit our exhibit

On STAND

No. 91

when we shall have pleasure in demonstrating to you the various features of design, all of which go to make the machine THOROUGHBRED.

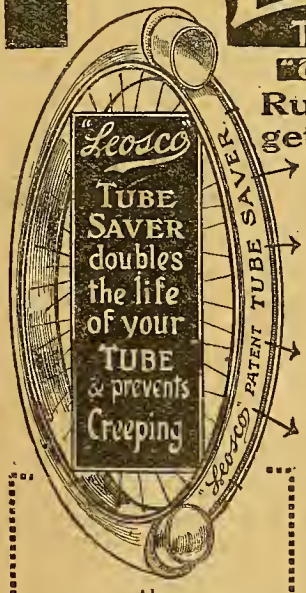
EMPIRE-DE-LUXE



Also Motor Cycle Super Suits, Non-nip Tubes, and Tyre Holders.

LEO-SCO TUBE SAVER

"The One & Only"

Rust simply *can not* get at your tubes.

MANY Motor Cyclists overhaul their machines periodically, in order to arrest wear and tear, but there is one spot which they seldom see: that is, inside the rims.

It is here that *rust* gets to work, slowly but surely, *all the time*—it never rests. It works at night whilst you are asleep—it eats inner tubes.

The Leo-sco Patent Tube Saver prevents the inner tube of the tyre coming into contact with rusty rims and with spoke heads. It saves the tube from danger and destruction. It acts as an additional buffer between the rim and the road, and prevents internal nips or punctures.

Order to-day—it will save you pounds!

Price 5/- each. Postage 4d.

Obtainable from all Agents, Factors, or direct from the sole Manufacturers and Patentees:

HAVE YOU EVER THOUGHT——

How delightful it would be to have a perfect safety razor that would enable you to obtain a quick, clean, and plea ant shave ?

The ROLLO-FOAM SAFETY RAZOR does this and more. It is really a new safety razor that embodies a device that no other safety razor possesses; the usual metal guard or "comb" is replaced by ebony rollers, therefore it does not scrape the skin, it rolls. The action of the rollers is delightfully smooth and soothing to the skin, and effects a perfectly clean and refreshing shave with ease and rapidity. It is easily cleaned after use by rolling over a dry towel.

The ROLLO-FOAM RAZOR is ALL-BRITISH made and of the finest quality and finish, packed in nickel-plated case, together with 12 blades and two plated blade cases.

ASK FOR THE R.F. RAZOR. **21/-** ASK FOR THE R.F. RAZOR.

COOLIE MOTOR CYCLE OIL

IF

you want your engine to **DO THINGS** you must help it. Study out its problems, heat and friction are two of its greatest bugbears, are you trying to minimise them? If you are, you will at once realise that discrimination in the matter of oil is called for.

There is oil—there is motor cycle oil—there is superfine motor cycle oil—and there is "Coolie"—

All users — and to-day they are numbered by the tens of thousands— admit that by using "Coolie" Motor Cycle Oil they have been able to secure a cool engine even under stress ; that even at the end of long strenuous journeys cylinders, etc., are exceptionally clean, and that perfect lubrication is absolutely assured by its use.

IT IS NOT GOING TO COST YOU A LOT JUST TO TRY IT (You can get a quart tin from any motor cycle dealer) **BUT IT IS GOING TO SAVE YOU A LOT IN THE LONG RUN IF YOU DECIDE TO USE IT.**

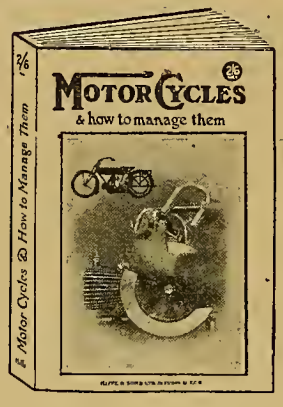
If you really cannot obtain locally you have only to write

The County Chemical Co., Ltd.,
"CHEMICO" Works,
BIRMINGHAM.

COOLIE MOTOR CYCLE OIL

ANOTHER NEW EDITION

(THE TWENTIETH)



of "MOTOR CYCLES AND HOW TO MANAGE THEM"—the Standard handbook on the motor cycle, its care and management. Fully revised throughout by the staff of "The Motor Cycle." Fresh matter added dealing with new models, lubrication, springing (forks and frames), etc. Many new illustrations. All obsolete matter deleted. 286 pages. Nearly 400 illustrations.

NOTE.

The Nineteenth Edition sold out in a few weeks, and as the demand for this edition is likely to be as great, copies should be secured without delay.

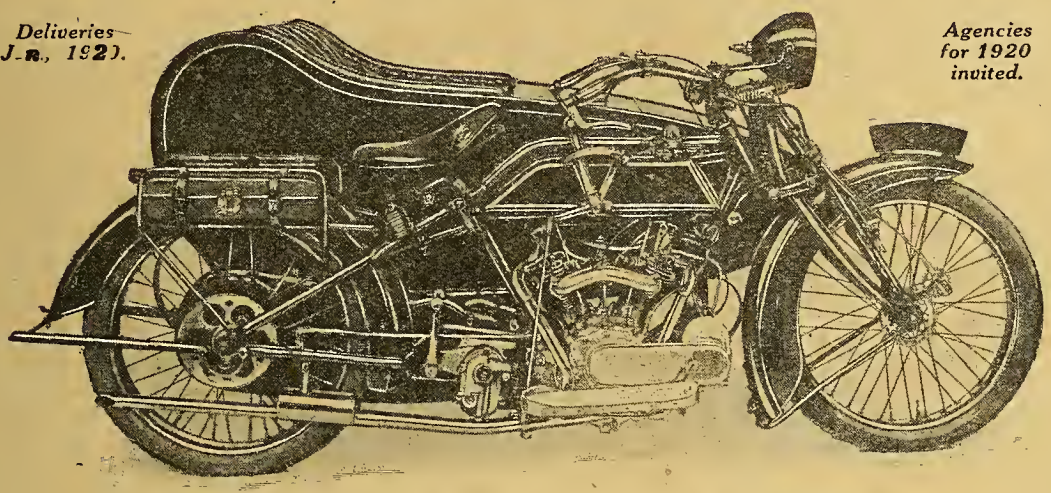
MARTINSYDE - NEWMAN

Deliveries Jan., 1920.



Agencies for 1920 invited.

6 h.p. "V" TWIN COMBINATION.

Specially designed coachbuilt sidecar.

SPEED, RELIABILITY, and COMFORT.

PRICE £170.

SPECIFICATION.

ENGINE.
70 m/m bore x 88 m/m stroke 680 c.c. 50 degree Twin Cylinder with special overhead exhaust valves, designed and finished to give perfect cooling, also giving a perfect scavenging stroke and ensuring even cylinder expansion. Side inlet valves, streamline valve pockets permitting high velocity of gas intake and exhaust. Fool-proof automatic lubrication of all internal parts by means of timing case-sump, thence by specially designed flywheel splash action regulated by carefully designed baffle plates. Twin-roller big end bearings. Extra large size ball bearings to both sprocket and timing sides of camshaft, set in specially thickened crank case to eliminate distortion.

IGNITION.
High Tension M.L. Magneto.

CARBURETTOR
Special Amac fitted with double control on handle-bar All parts heavily plated.

CONTROLS.
Ignition, throttle, air, exhaust valve lifter, clutch and front brake, all controlled from handle-bars.

GEAR BOX
A.J.S. 3-speed Countershaft with cork inset plate clutch kick-starter (manufactured under licence).

TRANSMISSION.
Chain enclosed in oil-retaining case.

BRAKES.
Foot controlled, band brake fitted to the rear hub.

FRAME.
Scientifically constructed and designed to give low saddle position, rigidity and comfort.

FORKS.
Brampton Biflex action springing, giving both vertical and horizontal motion (manufactured under licence).

TANK.
Square design, capacity 2 gallons petrol, ½ gallon oil. Fitted with large diameter filler caps, priming tap hand pump and semi-automatic drip feed.

FOOTREST.
Specially designed to give comfort.

SADDLE.
Brooks Saddle.

CARRIER.
Strongly constructed to take two Brooks long Pannier Tool Bags.

MUDGUARDS.
Designed to give ample mudguarding with side Valances.

STANDS.
Separate stands are fitted for jacking up either wheel.

WHEELS.
650 x 65 heavily plated black centres lined gold.

TYRES.
Dunlop's special 650 x 65.

EQUIPMENT.
Every machine is fitted complete with carrier, tool bags, number plates, inflator, horn, oil can and spanners and the machines are fully tested on the road before being delivered.

FINISH.
The highest possible workmanship in every detail. Enamelled black and lined gold. All bright parts heavily plated.

SPECIFICATION OF SIDECAR

CHASSIS.
For left hand side of Motor Cycle built of the finest quality steel tubing. Specially designed for accessibility and quick detachment.

SPRINGS
3 Leaf Cee Springs

WHEEL.
650 x 65 heavily plated black centre lined gold, fitted with Dunlop 650 x 65 Tyre.

MUDGUARD.
Specially designed for accessibility and ample mudguarding fitted with side valances to protect body from mud.

BODY.
Coach built painted Royal Blue panelled, lined gold and fitted with specially designed Luggage Carrier at the rear of body Upholstered Royal Blue.

FINISH.
Chassis finished in best black, bright parts heavily plated. Lamp bracket fitted, spanners supplied

EXTRAS.

HOOD.
Fitted with Auster's patent fittings and water-proof cover.

WINDSCREEN.
Auster's patent windscreen fitted as near the passenger as possible.

THERE WILL BE NO INCREASE IN PRICE DURING 1920 SEASON.

P. & M. 1920 Improvements

Engine Lubrication. P. & M. mechanical lubricator delivers fresh oil positively to the cylinder and big end alternately. No valves or springs are incorporated, the pump being foolproof. Increased engine efficiency, and reduced oil consumption are obtained.

Ratchet Hand Brake. P. & M. introduces a unique and much-desired innovation in motor cycle brakes. The P. & M. foot-brake ("the brake that never fails") is interconnected with a hand lever working in a notched quadrant, enabling the machine to be left on any gradient with perfect safety.

Foot Starter. P. & M. foot starter cuts out friction and waste of effort by acting directly on the engine shaft, and can be operated from the saddle in perfect comfort.

Suspension. P. & M. spring forks provide enormous bearings at the wheel spindle, and are, therefore, positively proof against sidecar drag. P. & M. abolishes useless seat pillar, and provides perfect saddle comfort.

P. & M. replaces straps on tool bags by quick-acting spring plates; fits a really efficient silencer, and provides mudguards and chain cases, which are unapproachable for neatness and strength.

P. & M. workmanship is the best in the world, and 1920 P. & M. finish will be more than worthy of P. & M. reputation.

P&M

Lessons of the Show.

STARTLING novelties were no more common at the Olympia Motor Cycle Show than in previous years. There were one or two innovations in engine design which show real promise, but this is not unusual at show time. To those who remember the Max and Motofrip, even the scooter is not new, though there are more exhibitors of this type of runabout than in previous years. Flat twin engines have encouraged the use of duplex frames, and in one or two instances these show that the designers have realised essential points in frame construction which are too often neglected.

Two-strokes have improved immensely, but there is often plenty of room for further advance. This stricture does not apply to two-strokes only, for the average four-stroke is still lacking in many refinements, particularly as regards silence and protection of valve gear, and the arrangement of cooling surfaces.

On the other hand, gear boxes show an enormous advance, and in some cases are well ahead of car practice.

Spring frames have obviously come to stay, and in this connection our readers will remember that the motor cycle has striven for this end for several years past. There is a general improvement also in spring forks, and a welcome tendency to an all-round increase in tyre sizes.

Dynamo lighting is increasingly common, and we note with pleasure the fact that many motor cycles look more like designed machines rather than a set of components strung together. Nevertheless, a lot of cleaning up remains to be done, and, if more designers had to look after and clean their own motor cycles, there would undoubtedly be an increase in accessibility and better mudguarding *of the engine and transmission.*

An increase in the number of passenger machines is particularly noticeable, and sidecars have improved to a very large degree. The passenger's comfort is a most important point, especially as it is usually one of the fair sex who occupies the sidecar. We were particularly impressed with the luxurious appointments of many high-class sidecars, and welcome with joy the reintroduction of spring sidecar wheels. This is perhaps the simplest and best method of overcoming the difficulty of chassis breakages.

There is a danger of the heavier sidecar outfits becoming over-developed, in which case they will undoubtedly suffer from the competition of light three- and four-wheelers, which start with the advantage of protection for the driver, while the more elaborate passenger motor cycles can no longer claim that they can be used as solo mounts if so desired.

Automatic carburetters and mechanical lubrication are two features which are becoming increasingly prominent, and we venture to prophesy that both will become almost universal in the course of the next few years, though at the present time the opinion of highly skilled riders and the prejudice of the old hands are often against them. At the present moment a few unsuccessful examples might cause a regrettable setback to what is undoubtedly a step in the right direction.

There were but two or three real lightweights in the Show. On the other hand, there are thousands of potential lightweight riders amongst those who are forced, by the shortage of houses, to live long distances from their work. There should be a fortune awaiting the firm that will first market a mass-produced lightweight shorn of all but essentials.

Scooters will probably attract a small portion of this market, but the main function of these little vehicles is to provide a handy method of quick shopping for the lady of the house, and of covering quite short journeys, while the lightweight motor cycle will undoubtedly form a convenient method of transport for quite long week-end outings, provided that really severe hills be avoided.

An Index to the advertisements in this issue will be found on advertisement page 76.

The Glory of Electric Lighting.

THE lighting dynamo will undoubtedly prove itself to be the most fascinating novelty of motor cycling in 1920. In a sense, it is not a novelty, for years ago we had good outfits on sidecar machines; but never before have we enjoyed powerful and reliable lamps on solo mounts. It is no exaggeration to say that the outfits transform nightwork. The road is flooded with light at a touch of the button—there is no "waiting for the smell," or blowing through a dust-choked water valve. The light is better than that of the best acetylene equipment, partly because it is absolutely steady, partly because there is no burner to interfere with the action of a scientifically-designed reflector. After three or four hours, the light is just as good as it was at the start, and you know its efficiency will continue all night, if need be; this is better than having to gouge out a sodden mess and recharge with carbide and water stored in awkward receptacles. The chances of trouble are so entirely remote that they are out of mind. Hour after hour the long beam stretches ahead of you, serving equally to illumine and to clear the road. Finally, when the destination is reached, there is no cleaning to be done.

Chances of Trouble.

FOR a year or so motor cyclists will probably display a certain nervousness about the reliability of dynamo outfits, but there is no longer any rational cause for alarm. So far as my experience goes, dynamos are nearly as reliable as magnetos. The possibilities of trouble are in practice confined to the accumulator, the wiring, and the lamp bulbs. The accumulator can, and should, be tested before each long ride. If it is fully charged at the start, only one mishap can befall it *en route*, namely, an internal short-circuit due to loose packing and vibration, for the fuse wire will protect it against external shorts. Therefore a fully charged accumulator, properly packed in its case, can be trusted to the limit. Wiring has made an enormous advance since the days of accumulator ignition, when our mounts were festooned with flimsy wires of indifferent quality and thoroughly bad fitting. Armoured wire, impervious to oil and wet, too sturdy to fracture as the result of "pull" or vibration, and very neatly fitted is the rule nowadays; and short-circuits on such wiring should be practically unknown. If a short occurs, the fuse wire localises the damage; and the tracing of the short is as simple as finding out whether petrol starvation is due to a choked jet, a choked feed pipe, or an empty tank. Lamp bulbs must give out occasionally—that goes without saying: but the modern filament is extraordinarily strong, and a bulb will often last a full year. Lamp stops by the roadside promise to become increasingly rare.

Sudden Darkness.

I SHALL not be surprised if the standard outfit does not undergo one modification in the course of time. An electrically-lit motor car is normally driven at night with four forward-facing lamps. Should one, two, or even three of these lamps suddenly be extinguished by an electrical fault, no danger arises; the surviving lamp or lamps give sufficient light to enable the driver to pull up in safety. Solo motor-bicycles only carry one forward-facing lamp, and, if it is suddenly extinguished—especially on a twisty road—the situation is none too pleasant. Of course, this peril is common to electricity and acetylene alike. But two factors add to its unpleasantness where electricity is the illuminant. Acetylene very seldom fails instantaneously; indeed, I have never known it to do so, except when a rider's body pinches a badly fitted gas tube. But a solitary electric bulb may plunge the rider into Cimmerian darkness at any moment, though in practice such a mishap will not occur more than once a year. The second factor is that electric lighting is so bright that riders are tempted to drive rather fast with it. Perhaps there will be 100,000 dynamo-lit motor cycles on the road in 1921: if each of them is suddenly plunged into darkness once in that year, some of them will be riding fast on awkward roads at the time and a crop of accidents will occur, most of them quite petty, no doubt, whilst the total will be insignificant compared with the enormous mileage which will be covered in safety and pleasure. Still this consideration rather suggests that it is unwise to rely on a single forward-facing bulb, and that the outfit of the future will include a second low-power bulb, consuming very little current, which will safeguard the pull-up when the main head lamp bulb chances to go out of action without warning. Subject to this consideration, the new dynamo sets are simply ideal.

The Fair Sex and Scooters.

TWO correspondents have assailed me privately with much vigour for a paragraph published under the above heading on November 13th. I cannot retract a word of it. Not a word of it had reference to experienced girl riders. It was inspired simply and solely by the somewhat cynical fashion in which a section of the trade is inclined to exploit a section of its potential female custom. Feminine motor cyclists as a class stand to-day pretty much where men stood twenty years ago. They are keenly interested in the hobby, but know next to nothing about it. Even the ex-Service girl riders cannot wholly be excluded from this assertion, for most of them handled machines which were inspected and overhauled nightly by male mechanics: conditions which in no sense apply to private ownership. Hence the girls must not take it amiss if men who have paid dearly for experience try

Occasional Comments.—

to help them. Years ago the trade pretended that their machines were much more efficient than the facts justified. We accepted their word and bought machines which were fundamentally bad. So far as touring mounts are concerned, the girl novice of to-day runs no such risks as we men ran in our novitiate long ago. These machines are so good that a feminine novice without mechanical instincts should have a very happy time in her first season. But, as I stated on November 13th, this is not necessarily true of scooters. Scooters have been largely ordered by women, and by women of a type who may never make motor cyclists, even under the best conditions: for example, elderly women, who are not even pedal cyclists. Some of these women live in districts where the roads are more often greasy than not and where hills which will puzzle any scooter are common. The local agent in most cases does not yet possess a demonstration mount on which a trial run can be accorded: in some cases he has never either seen or ridden a scooter himself. On the other hand, there are scooters on the market which cannot be termed good hill-climbers. It follows that some firms and agents have slipped into grossly unsound business methods. If I were a scooter agent in Newcastle or Torquay or Inverness, and an elderly woman tried to place an order with me for a scooter which I had never seen, I would not jump at the business. I should accept the order provisionally, maybe; but I should invite her to come round and test my demonstration model as soon as it was delivered and give her the option of cancelling her order if she desired.

A Show Memory.

IT is hardly conceivable that a few years ago the new model motor bicycles were thinly sprinkled through a giant assembly of push bicycles, and that the whole caboodle was easily stored in a far smaller building than Olympia. Most stands staged twenty or more pedal cycles to each motor cycle, though the latter usually had the place of honour. It took the centre more because that was the only way of balancing the exhibit than because it was answerable for the bulk of the business done. The general public consisted largely of youths with exaggerated calves and thin black stockings, and the few motors on show evoked quite as many sneers as plaudits. The provincial agents treated the petrol side of the affair quite cavalierly, and the visitors drew caustic contrasts between the pleasing appearance of an exhibition motor on a red velvet platform and its subsequent eccentric, noisy, and dirty progress on the road. If one desired to make a technical enquiry, or—*mirabile dictu*—to place a definite order, one shouldered one's way into the office through a crowd of sleek people discussing free-wheels. When one secured a hearing and the astounding fact that this well dressed fool actually wanted to *buy* a motor bicycle became plain, there was a frenzied search for "our Mr. Jones," who alone of the staff knew how the beastly thing worked. Unless memory has betrayed me, I once attended a Stanley Show which was graced by just one solitary motor cycle, and the crazy individual who had the temerity to invade the holy of holies with the contraption had to seek refuge from the chaff of an outraged industry in an outside bar for the remainder of Show week.

A FEW DETAILS AT THE SHOW.

SOME NOTES ON SIDECARS AT OLYMPIA.

A General Review of Sidecars with Special Reference to the Comfort and Convenience of the Passenger.

By W. G. ASTON.

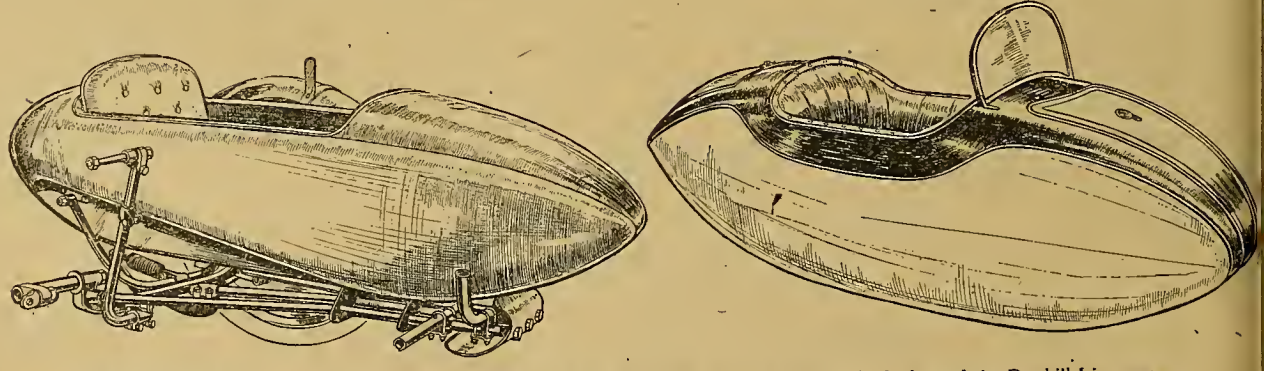
CONSIDERING how very little he knows about them, the average motor cyclist takes quite an interest in sidecars. At Olympia Show, under the benign influence of feminine persuasion, he even goes so far as to try some of the more attractive-looking models—an action which, in so far as real judgment is concerned, is just about as effective as trying to assess the merits of a car by sitting in the dickey seat. But it leaves him in total ignorance of the fact—as from personal experience I am prepared to testify—that the modern sidecar represents probably the most luxuriously comfortable form of road travel known to mankind. The motor cyclist—wise man—appraises the sidecar purely and simply as an auxiliary to his machine. Will it make a favourable-looking combination? Is it light enough? Is it strong enough for those hill-climbing stunts, etc.? Once upon a time I adopted this attitude myself. I permitted any justifiably regular passenger to select her sidecar, whilst I attended to the wangles associated with early delivery of the gallant machine that was to propel her and me. I have since perceived that I was grievously mistaken. I ought to have sent her to a motor school to learn how to control a powerful twin, whilst I sampled and chose the attachment that was to float me over the rough roads and lull me into delicious mental abstraction with its lazy, nonchalant, easy-going motion.

Converted from Saddle to Sidecar.

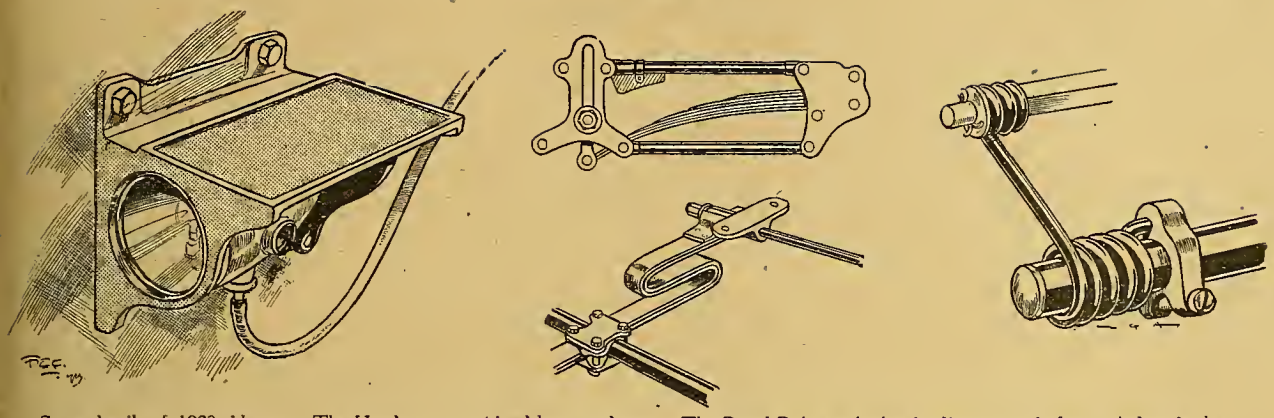
This enthusiasm for sidecars is a war product, purely and simply. In the course of duty I used to bestride Triumphs, Douglases, and Clynos, and do my best, as in duty bound, to dash them to pieces on the highways and byways of Flanders and Northern France. But one day, in a fit of generosity—I had been consistently putting a vertical gust up my mechanist sergeant, and thought it only fair to let him have a return match on me—I climbed into the sidecar. From that day forward I renounced the saddle in favour of the life of padded luxury which I found was assured by acceptance of the passenger seat.

Perfect Comfort.

Such being the case, I hold it quite impossible that the Editor of *The Motor Cycle* could have pitched upon anyone ready to deal with sidecars with greater enthusiasm. Had I the liberty to do so, I could write reams of appreciation. As it is, space forbids me to let myself go. Suffice to say that, the war being over, fate ordains (without regard to my own personal views upon the subject) that, with no mechanist sergeant, I must return to a saddle that is a little less strenuous than of yore—thanks to spring frames. I shall do so without protest, for the saddle has joys of its own—but I shall never look upon the sidecar again as once I did. Setting aside malice and all uncharitableness, I shall still regard its occupant with envy. The sidecar combination may be, and I make no doubt certainly is, the *Ultima Thule* of economical motoring, but from the moment he or she climbs into the nest of cushions and repose, the sidecar passenger is one of the idle rich. Idle, you who have mended punctures whilst she powdered her nose, will easily grant. Rich? Who wants greater wealth than the enjoyment of speed, air, scenery, and perfect comfort. And all that with a complete detachment that is only comparable to sleep.



Sporting doorless sidecars: The Canoelet, which has a wide section domed guard sprung on the body, and the Dunhill Limousette.



Some details of 1920 sidecars. The Henderson combined lamp and step. The Royal Ruby springing in diagrammatic form; below is the body springing of the same machine. On the right is seen the front springing of the Montgomery.

It appears as if the resources of science had been ransacked in the interests of promoting sidecar efficiency. The modern sidecar is a good-looking affair, graceful in outline and pleasing to the eye no less than to the vertebræ. The suspension is a miracle of thoroughness. Between the passenger and the bump on the road are interposed a variety of shock-absorbing devices. First, the cushions—and these are better than ever. Secondly, the body springs connecting the *carrosserie* (this is the word!) to the chassis. Thirdly, the chassis springs connecting the frame to the axle. Finally, the pneumatic tyre. Here is a fourfold defence that nothing short of an explosion can penetrate. Some designers cut out the chassis springs altogether without, apparently, ill effects. But whether or not, in solving the problem of providing perfect comfort to the only thing connected with the modern motor cycle that does not work, they seem to have all found a different solution.

Here follow a few notes on sidecar design as revealed after a buffeting walk round Olympia.

A Welded Chassis.

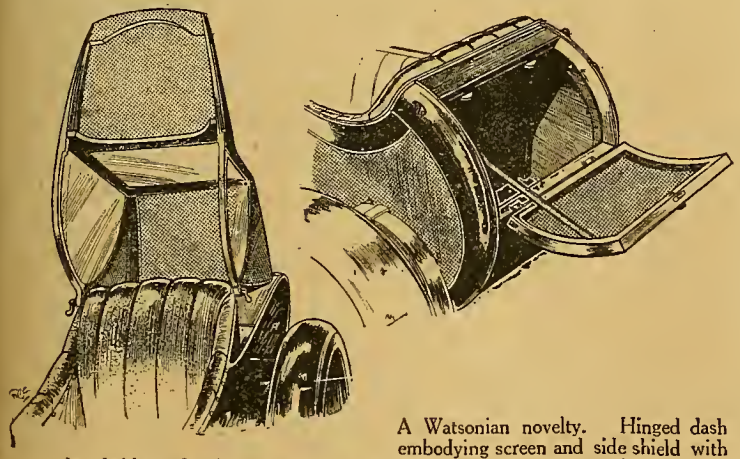
The Bamco design is full or originality. The body reposes upon coil springs contained in cylindrical housings, which act as slides and guides for a pure up-and-down motion. At the base of each slide is a rubber buffer to take up the return shock. The axle is itself sprung, the hub of the wheel being supported by a link arrangement with coil springs in tension. There is a neat little aluminium stepboard, so beautifully polished that it would be a shame to set foot upon it. The chassis is made of tubes acetylene welded together according to the best aircraft practice. There are no lugs of the ordinary kind whatever. A two-seater model chassis, in which the axle is not sprung, has been tested for a long distance with a load of one and a half tons. Sidecar passengers will regard this no doubt as an insult, but it certainly is the right sort of test. On another Bamco model (all sidecar firms make a great many models—they are all so good that no one can make up his mind which is best) the chassis is suspended on leaf springs and the body on the usual strip C arrangement.

Detachable Wheel.

The Mills-Fulford models are distinguished by great strength in the frame, whereof the tubes are duplicated to provide great rigidity. When lugs occur, these are generously webbed. The mudguards, one noticed, in the new design, are supported by stays radiating from a star or spider at the hub. This has been done to facilitate ease of replacement in case of crash, and to eliminate any possibility of looseness or rattle.

In the Rex combination detachable wheels are fitted. The sidecar wheel is enclosed by an elliptic tubular stay carrying the outer extremity of the hub. This stay, however, is easily freed, so that it can be hinged out of the way. The spare wheel is carried at the back of the sidecar in a metal pan, and has its hub secured to a slotted standard. The sidecar itself has a rigid frame, and the body is suspended each side on long cantilever leaf springs. In front it is supported on double coil springs capable of absorbing the rebound. A noticeable point is that to relieve the chain stays of possible strain, a long diagonal tube runs from the front head of the cycle to the rearmost sidecar attachment. The sidecar chassis is also itself heavily braced diagonally.

In the Grindlay design one finds that the chassis is carried on a couple of long half-elliptic springs, one each side of the wheel; whilst the body is independently supported on full cantilevers, with double coil



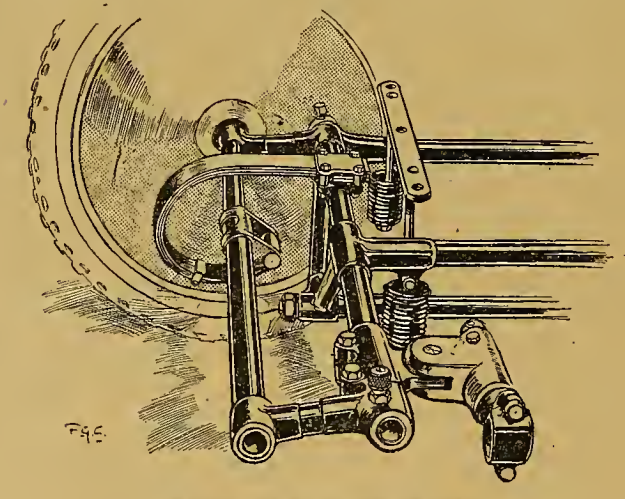
A Watsonian novelty. Hinged dash embodying screen and side shield with detachable roof and curtains. On the right is seen the Rover rear locker.

Some Notes on Olympia Sidecars.—

springs in front. The *modèle de luxe* has a celluloid screen with metal and wood framing. This is carried on folding tubular stays, in the manner of the Auster rear screen for cars. It is adjustable as to angle and distance from the passenger, and when not required folds down flat on the apron. The hood is effective and simple in operation.

Ample Carrying Accommodation.

The Henderson is one of several samples which unmistakably suggest that, as a master of springing, the sidecar designer has no equal. In this case, the chassis being rigid, the body is mounted upon cantilever springs, at the normally fixed end of which are additional coil springs in compression. The front springing is of the flat-leaf C variety. At the back of the sidecar one finds admirable luggage accommodation. A big locker has a rubber-covered top with a rail, so that suit cases may go both without and within. On a lighter model, the body is carried on plain coil springs. As if this were not enough, there is a special model definitely designed for rough roads (as though there were anything but patches of the other sort nowadays!). In this the axle is sprung upon a central inverted C spring, whilst between the body and chassis are coil springs in tension at each side.



The spring axle on the latest Henderson.

These people have a neat little aluminium step, which contains a side lamp, and is screwed on to the sidecar flank. It can also be made to act as a bracket for a metal-covered tool case.

The Watsonian models are equipped with the conventional form of suspension, *i.e.*, C springs behind and coil springs in front. A *de luxe* type consists of a sort of coupé having a weatherproof head with front screen, and side panels of celluloid, which, after being lifted up to allow ingress, close down upon the passenger in a somewhat formidable manner. However, if she is disposed to "go quietly," you can unbutton the leather part of the hood. Adjacent to this stand I heard one or two anxious motor cyclists breathing the magic words, "mother-in-law," and evidently the design appealed to *them*. This is, of course, only chaff. As a protection against wind and rain, I would give the design something approaching "full marks," especially as it comprised really good luggage capacity. It had a commodious boot big enough for a couple of petrol tins, and an aluminium-covered lid, quite large enough for ordinary luggage. There was also a sporty fishing-float shaped light sidecar: long, neatly streamlined, and roomy. In this there was a good sized locker behind the back cushion.

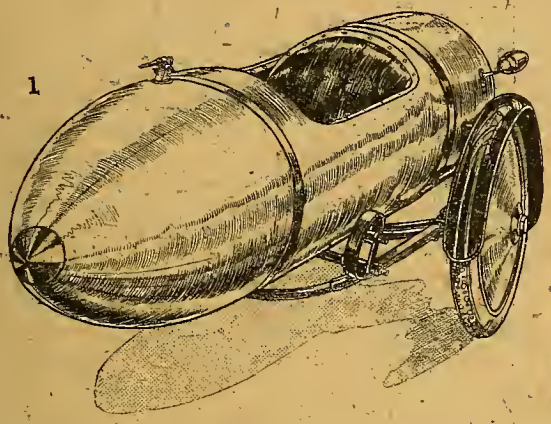
Super Springing.

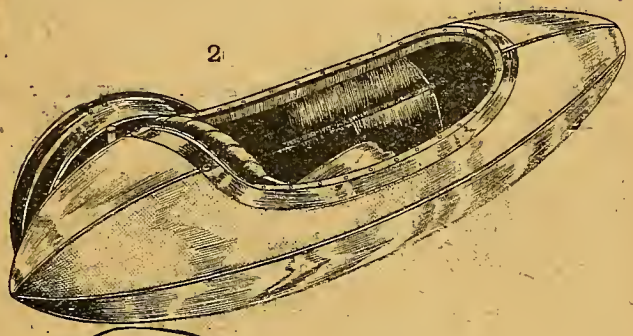
I imagine that it would take a considerable road shock to get past the A.B.C. sidecar suspension. The wheel is connected to the chassis with a many-leaved "grasshopper" spring. The body rests upon long C's behind, and upon a transverse-shaped leaf spring, semi-elliptic, in front. One noticed also that the rear sidecar attachment embodied a ball universal joint on the chain stay of the bicycle, so that absolute independence of action as between sidecar and machine was provided for. I likewise admired the very graceful Gracemill body on an A.B.C. chassis. This was an excellent example of neat aluminium panel beating. Weighing only 44 lb., the body had locker room in the "toe," and cupboard space under the seat. When unoccupied, it could be completely covered in with a detachable twill apron fixed by patent fasteners.

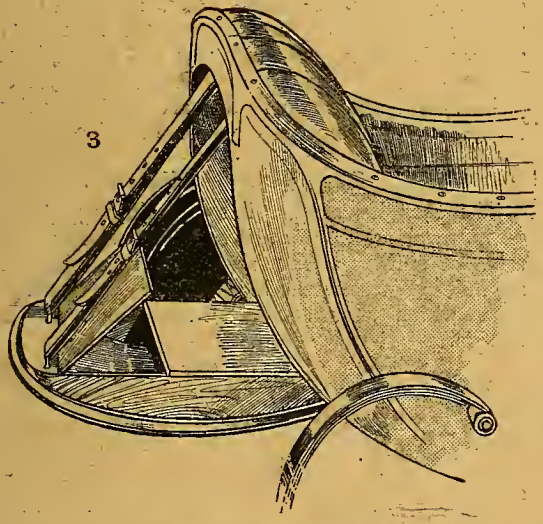
A curious exhibit was the Shell sidecar body on the Sidecar Body Co.'s stand. It was even complete with a copper obturator ring which is guaranteed to give it a gastight fit when passing through the air. The "shell" was of aluminium, the rear portion squared off contrary to aeronautical principles, but strictly in accordance with projectile design. This provided considerable locker accommodation. As far as I could see, the only point in this highly original design was the very sharp fuse cap in front. A more practical type was a sporting sidecar of hydroplane form, shallow, but remarkably roomy. For its kind it struck me as being unusually comfortable, and was agreeably well sprung and light.

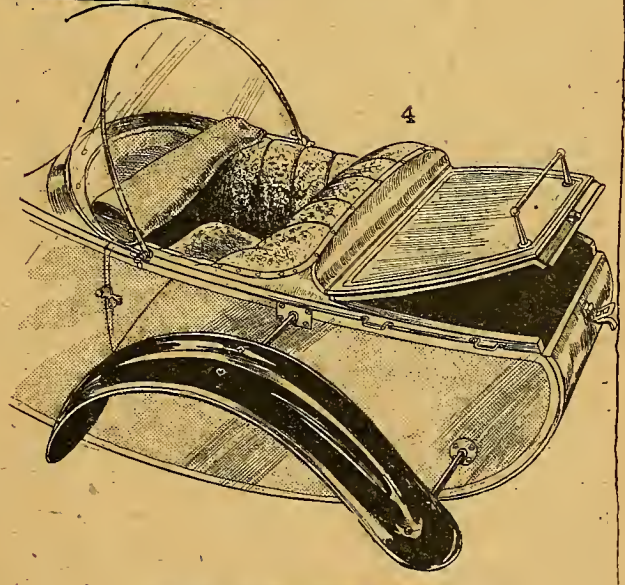
On the Sandum stand, one perceived that sidecar makers have no fear as to the power of motor cycles. Here are found a couple of comfortable two-seaters, one of the permanent type complete with a separate door for each passenger. Considering the accommodation provided, this model was remarkably neat. A second design had a folding front seat, which, when not required, almost miraculously slid into the top panelling, out of sight and out of the way. In order to provide the front passenger with extra leg room (standing over six feet I was touched to the quick by this solicitude), a portion of the toe of the body opens out into a capacious pocket like the bellows of a camera. The more ordinary type of body I had the more cause to admire. The chassis was unusually strong and the finish good. The feminine passenger would appreciate the glove box and mirror—this is real luxury—provided in the single-seater. There was also a neat and light racing type. One of the most practical sidecar screens I saw in the Show was on this stand. It consisted of a broad celluloid shield with leather edging held in standards in such a way as to be adjusted in all required directions, and, furthermore, it gave instant ingress and egress from the body. I also inspected details of a distinctly

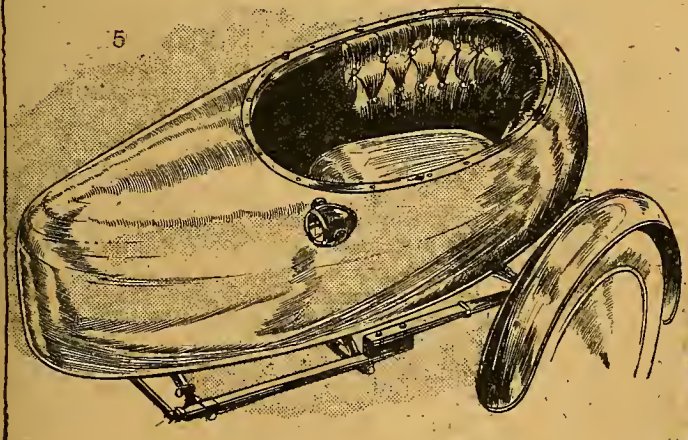
SOME EXAMPLES OF SIDECAR BODY-WORK FOR 1920.

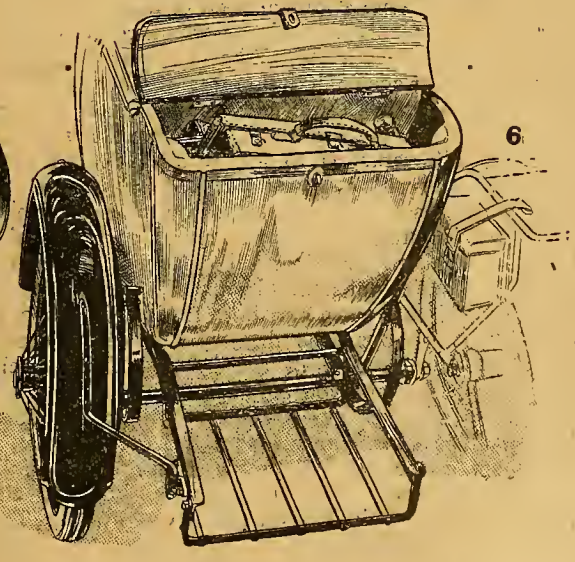












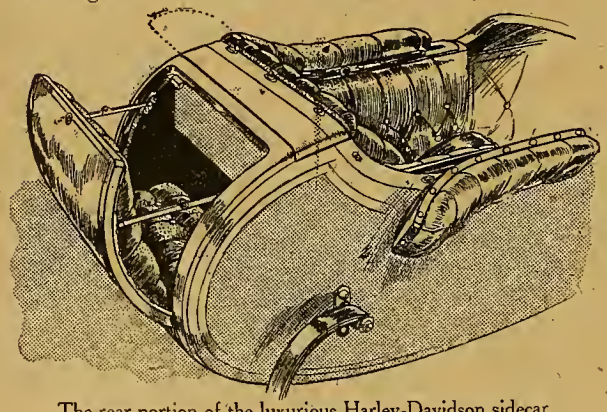
1. A shell type body exhibited by the Sidecar Body Co.
2. Watsonian "R 34" type, sporting model sidecar.
3. A newly designed Millford sidecar with a folding grid.
4. A very capacious locker in the rear of the Henderson.
5. An egg-shell aluminium body fitted to the A.B.C.
6. Rudge sidecars are provided with a deep locker.

Some Notes on Olympia Sidecars.—

clever and practical screen used on a sort of coupé hood. This works on the roller blind principle, and appears to be perfectly weatherproof.

Infant Necessities.

Dunhills are people who evidently believe in the need for roominess. Their Limousette—I do not know why so-called any more than did the stand attendant—has a body of agreeable and unusual depth and of remarkable comfort. I would have asked nothing better than to recline in it, peruse *The Motor Cycle*, and listen to the melodious band. Alas, other duties called. But I had time to observe and admire the adequate locker accommodation at the tail of the body and to appreciate the neat fixed windscreen. A second Dunhill design of sidecar has a body swelled out on the off side, *i.e.*, towards the motor cycle, so as to allow the mother and the che-ild to be there. This seemed to me to be a sound solution of the family problem, the infant being firmly fixed between Mamma and Dadda, so that, in the event of precocity, he can get it from both directions at once.



The rear portion of the luxurious Harley-Davidson sidecar.

In Mr. Norton's excellent design, he displays a true knowledge of motor cycling requirements. His sidecar, whether it be just the ordinary standard model or the *affaire de luxe*, has plenty of roominess. He provides broad semi-elliptical section mudguards, and he allows for plenty of locker accommodation, as is well shown in the sketch. What I particularly liked about the locker accommodation was that it was divided into two spaces by a hinged wooden panel, so that clothes may be kept separate from petrol tins. The screen is adjustable as to angle, and is fixed to a hinged scuttle, which is readily lifted out of the way to allow the passenger to get in and out. Mr. Norton's views on children are, however, at variance with Messrs. Dunhills. In the family machine the child's dickey seat opens out at the back. Should the fire of juvenile questions come too hot, Daddy, in response to a signal, can open the throttle a little and drown inquisitive conversation in the breeze. Well, well, Mr. Norton, perhaps you are right.

There is a rather unusual suspension in the Scott sidecar. The body is carried on, and sprung from, a cross tube connected with a bell-crank, which pulls against a horizontal central tension spring. In the front the car is mounted on small C springs. The arrangement is very simple and efficient.

No examination of sidecar design would be complete without reference to the Royal Ruby, which embodies an unusual volume of elaborate workmanship. The body is supported upon Z shaped leaf springs, four in number, whilst the axle responds to the action of a grasshopper leaf spring which is limited in travel by a rubber buffer. The chassis as a whole, to say nothing of the motor cycle, is a remarkable example of tube work. For ease of interchanging the detachable wheels, the sidecar mudguard is readily removable. The sidecar chassis, by the way, is connected solely to the sprung part of the cycle frame. At its rear is a box of sufficient size to hold two two-gallon tins of petrol, and this is surmounted by a luggage rack. The battery box for the electric lighting set is under the sidecar seat. These points are made clear in the accompanying sketches.

I could not possibly pass by without mentioning the nice-looking Harley-Davidson sidecar, with its windscreen complete with adjustable side panels, its child's dickey seat at the back, and its—wonder of wonders—concealed hood. It just showed what a sidecar designer could do when he let himself go, and was enough to make any Rolls-Roysterer envious. It is a good thing that in this article I have been able to keep away from the question of prices!

Simple and Effective.

The Douglas sidecar has a springing system quite of its own, and, I should say, both simple and effective. C springs at the front work in conjunction with an inverted transverse half-elliptic leaf spring at the rear, which should result in complete freedom of motion.

On the Triumph outfit one finds that, whilst C springs are used for the body suspension, the wheel is separately sprung on volute springs, and a stout U-shaped link hinged in front. Room for a can of petrol is provided between the cycle and the sidecar.

I came to the conclusion that the Rudge sidecar was extraordinarily well made, and I confess I liked the polished aluminium toe panel. I hope this was not just "Show finish," as it lent an agreeable air of distinction to the *ensemble*. There was a sizable luggage grid of L section members sprung with the body, and also a roomy locker at the rear covered in with a lid that had every appearance of being really weatherproof.

In the new Rover sidecar combination one found several points to admire. First, the wide domed mudguards, then the general neatness of the body with its good locker accommodation at the back. One noticed also that to get the chassis nice and low the attachment to the cycle chain stay was made through a rigid right-angled stay — possibly ungeometrical, but effective.

The Clyno sidecar has been well considered to act with a spring frame. The chassis thereof is suspended on a long leaf spring, in addition to which the body has C springs. The sidecar wheel is well supported each side by an elliptical tubular framework which acts as a front-pivoted radius rod. In the rear one finds a useful luggage carrier.

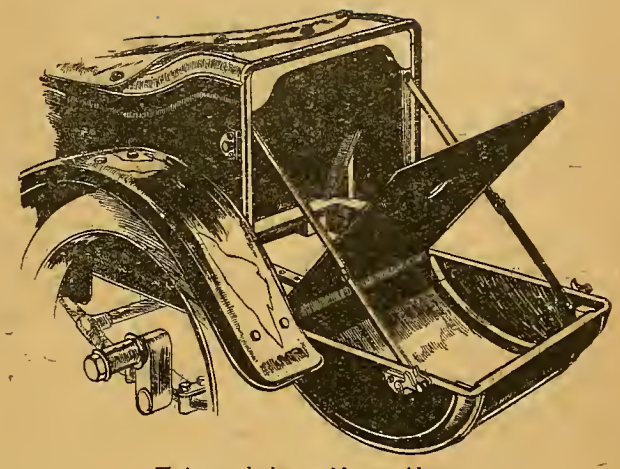
I was enjoined not to get into the Bat limousine sidecar: a reduction in miniature of the sort of thing

Some Notes on Olympia Sidecars.—

one associates with a 45 h.p. Daimler. However, it *could* be got into, as I saw several people in it. Another mother-in-law joke! Needless to say, the unlettered halfpenny press leapt at it, and the explosion of their flashlights o' mornings was as the bombardment preliminary to the Somme push.

The A.J.S. people have a shrewd and practical idea as to what a sidecar should be like: at all events, in point of luggage capacity. Under their suit case platform they provide a useful toolbox, and (which is something to make a note of) the spare wheel can be extracted without trouble, even when the suit cases are strapped in position.

The Matchless designers always express strong individuality. In their sidecar are found coil springs used throughout, the same being adopted on the motor cycle spring frame. By this means both chassis and body were independently suspended, though at the front quarter-elliptic leaf springs were adopted.



Twin rear locker on Norton sidecar.

The Fifth Annual Banquet of the Cycle and Motor Cycle Manufacturers' and Traders' Union, Ltd.

THE annual banquet of the Motor Cycle Manufacturers' and Traders' Union was held at the Criterion Restaurant on the 21st ult., under the chairmanship of Mr. C. A. Hyde, the president.

The toast of "The Manufacturers' Union" was proposed by Mr. Edward Manville, M.P. for Coventry. He said that Coventry was the centre of the industry, and he hoped it would long remain so. Speaking of motor cycles, he mentioned the great strides that had been made in the construction of these machines. He dwelt at some length on the importance of exhibitions.

In reply, Mr. C. A. Hyde spoke of the demand for motor cycles, and referred to them as the most efficient and reliable means of light transport at the present time. The demand was in excess of the supply, but he hoped that this would soon be overcome.

Mr. A. Brampton, J.P., proposed the toast of "The Guests," which was replied to in a speech by Lt.-Col. Sir Rhys Williams, Bt., D.S.O., K.C., M.P. Speaking on behalf of the Transport Ministry, and not, he said, as a motor cyclist, he mentioned what the Ministry was doing for the roads, and pointed out that the Ministry was greatly interested in the motor cycle industry.

This was replied to in an excellent speech by Mr. H. Massac Buist.

The toast of "The Chairman" was given by Mr. H. Bowden, who in the course of his speech said how fine a thing it would be for the industry if workmen and masters agreed upon peace just for one year, so that the remarkable results in the way of output achieved during the war might be repeated now the war is over.

The I. A. E. Meeting at Olympia.

A Discussion of the Judges' Report on the A.C.U. Six Days Trials.

ON Thursday, November 27th, the Institution of Automobile Engineers held a meeting at Olympia to discuss the judges' report on the A.C.U. Six Days Trials. The meeting was open to all interested.

The Chairman, Mr. Clarkson, in introducing the subject, stated that there appeared to be a considerable divergence of opinion as to the justification of certain views expressed in the report.

Mr. Webb *(The Motor Cycle and Cycle Trader)*, who was partly instrumental in the meeting being convened, called upon constructors to give their views; and

Mr. Basil Joy (secretary I.A.E.) read extracts of the report, calling attention to the more contentious points.

Many well-known figures in the motor cycle world took part in the discussion, including Messrs. H. A. Collier, E. B. Ware, D. Leechman, J. E. Greenwood, Hugh Gibson, J. L. Norton, and others.

The subjects of the silence test, consistent driving test and examination of machines were much criticised. Several pointed out that old machines which completed the trial successfully were likely to be unduly penalised on the score of condition.

Mr. Norton made some telling remarks against water-cooling and the adoption of large multi-cylinder engines, as suggested in the report; and Mr. Leechman and others criticised frame design, from an engineering standpoint, in no uncertain terms.

Mr. Loughborough, in an excellent speech, made a masterly reply for the A.C.U., and Dr. Low gave a turn of humour to his defence of the audiometer.

The Chairman, in summing up, stated that the discussion was most useful and practical, and that a report, in full, of the proceedings would be forwarded to the A.C.U. for reference.

The meeting, at which about fifty well-known trade representatives were present, was concluded by a hearty vote of thanks to the chairman.

SOME SHOW IMPRESSIONS.

Political Tendencies of the Motor Cycle Movement: Observed by B. H. Davies.

THE keynote of the 1919 Olympia is not mechanical, but political. Veteran Show *habitués* like myself enter its portals with brains bubbling over mechanical innovations. In five minutes we have completely forgotten the new engine for which we were making tracks, and are gazing in mute astonishment at the crowd. The Show is the first incarnation of a changed England. In former years, until the Saturday night came round, the stands were thronged by tweed suits and the Oxford manner. This year the bulk of the buyers who mean business are plainly men who wear fustian, corduroy and dungaree from Monday morning till Saturday midday; and most of them adorn the King's English with a charming burr or accent of some kind, which banishes wet, foggy London, and reminds one of bygone tours to the West or the North or to Shakespeare's country. We welcome these new recruits warmly on all grounds. Hardly less noticeable is the influx of riders of the fair sex. *The Motor Cycle* always prophesied their coming, even in days when petrol and petticoats were poles asunder. The war has transformed thousands of girls into embryo engineers. The scooter has opened the door to the mothers no less than the maids. The new wage standards have solved the special financial problems, for the modern maid does not have to wheedle cash out of Papa—she earns plenty, and can afford to motor cycle if she can resist the rival temptation of the lingerie shop.

The New Type of Motor Cyclist.

Whereas a typical 1913 customer wanted a single-geared 8 h.p. J.A.P. with overhead valves, a quite predominant type of 1919 customer is after a powerful combination with ample accommodation for several olive branches. He does not want a stunt machine. Most of his riding is done at week-ends. It is his safety vent from the mine, the factory, and the Bolshevist microber. There is no nurse to mind the babies, so they must come along as well. He plunges for solid, reliable family transport. He does not mind getting dirty, for his job is a dirty one; so he is not as down on current mudguards as the man who wears pale mauve socks might be.

The maidens, too, will have their say presently. At present they do not know enough to be sure what they want. They are acquiring their experience, and the critical mood will develop later. Besides, there have never yet been enough of them to interest the factories. At the moment, we can offer them very little choice. Many of them must elect to straddle machines designed specifically for males. But they will stamp their own hall-mark on the industry in a year or two. And who can doubt that their influence on technical developments will be a corrective.

Turning from the spectators to the stands, my brain kept running on the two new types of customer broadly outlined above, and I consequently felt less astonished at the general similarity between the exhibits of 1919 and those of 1913. On the bulk of the stands all that was new might be summed up as "dynamos and details." Complete breaks with the past are certainly to be seen: witness particularly, of course, the A.B.C. and the Precision. But whether the cause is innate conservatism, or the desire for early production, or the fact that the industry is nearer its technical zenith than dreamers fancy, or the trade grasps on the fact that most of its 1920 customers desire staunchness rather than novelty and frills, fundamental innovations are scarce. In the old days we made the best motor cycles in the world, bar none. To-day we offer the same stuff, perfected in detail, and adorned with the first roadworthy lighting system motor cycles have ever had. The new breaks are like the gold medal blooms at a National Rose Show. Everybody has a stare at them. The specialists and the rich men buy them. The canny enthusiast with a limited purse covets them earnestly, but often decides, "I'll wait and see if she is a good goer!"

Sighs for the Ladies.

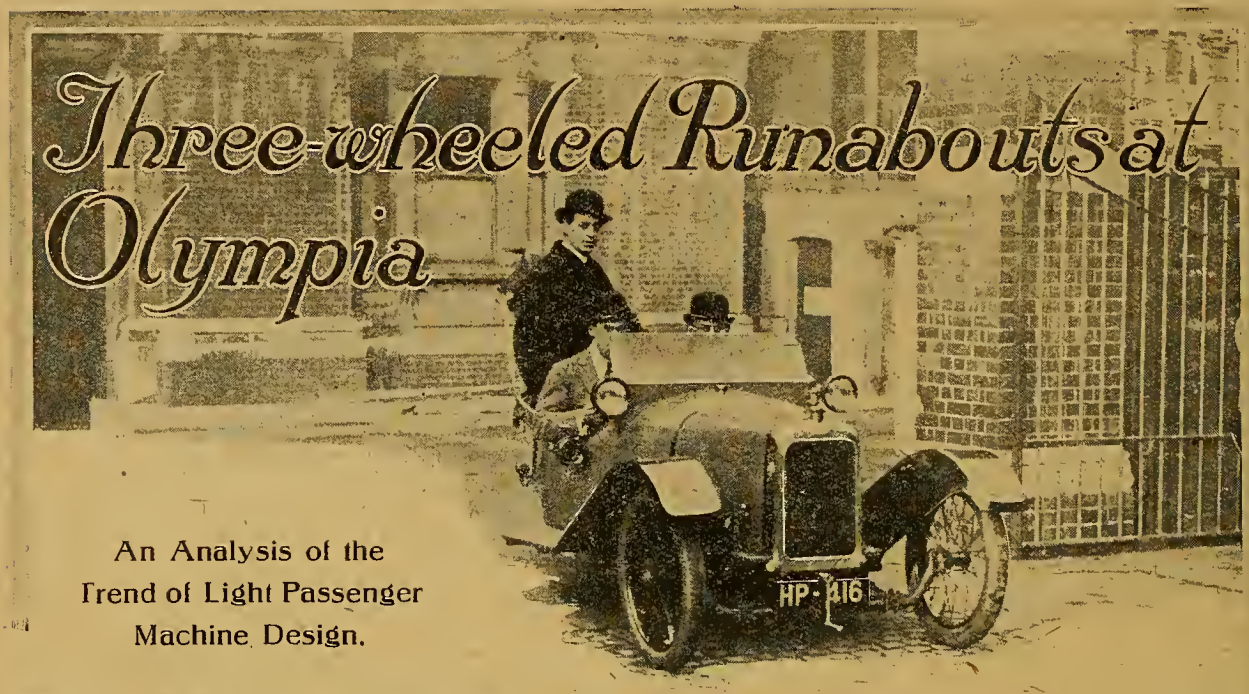
History, nevertheless, repeats itself. Items which are no longer novelties to the journalist, because he bought and tested them when they were audacious experiments, are practically novelties to thousands of users. But only a small percentage of the great crowds at Olympia last week have ever owned a lighting dynamo, a detachable cylinder head, a spring frame, a two-stroke engine, an overhead valve, or any flat twin larger than 350 c.c., not to speak of all-chain drive, automatic carburetters, integral speedometer gearing, four-speed gears, leg-shields, underscreens, and other items, which now excite no heavy comment from experts, and may all be standard practice within a year or two. Mechanically speaking, the real novelty of the Show lies in the popularisation of items which were semi-experimental in 1913. The average buyer of a new machine will take delivery of a specification including five or six vital items which are absolutey new to *him*, and his 1920 riding will, therefore, be pregnant with excitement.

I confess to feeling rather sorry for the girls. I have often lent my machine to them, and taught them to ride. When they can handle a mount, and produce the cash to buy that first mount which is either the grave or the parent of many dreams, I seldom know what to advise. Recommend a man's machine: they may take to it, they may hate its weight, or they may dislike trotting round in breeches when the day's run is over. Recommend something small, and when the bridal ecstasy is over, they will either rave about it continuously, or stigmatise it as a mere toy. I give my girl friends a wide berth at Show time, and I earnestly hope the trade will give their needs more attention before November, 1920. But I notice that they are all very interested in the A.B.C., and I have the wind up; for many of them noticed a picture in *The Motor Cycle* for March 20th, which showed me dandling the experimental bantling in my arms, and as they haven't read the A.C.U. trials report they don't know what the production model weighs. One or two slim-wristed damsels I wot of will murder me when they find out, but, please, ladies, it wasn't I who put the dynamo, etc., on it.

Impressions of the Show.

By Helen McKie.

Three-wheeled Runabouts at Olympia



An Analysis of the Trend of Light Passenger Machine Design.

THE increased and still increasing cost of motor cycle and sidecar combinations has had the effect of drawing closer attention to the alternative type of passenger-carrying three-wheeler, for there no longer exists the pronounced difference in prices that obtained at the time of the signing of the Armistice and for several months after. The price of the three-wheeler with two seats side by side, giving protection for the driver equal to that afforded on a car, very closely approximates the cost of some fully equipped sidecar combinations of 6 to 8 h.p. The respective prices do not differ to any great extent and for the most part are in the region of £200, although in one case a three-wheeled light car costs £250. In all cases the price covers comfortable seating for both occupants, a windscreen shielding the driver as well as the passenger, and a hood that protects both from the elements. But £250 is an exceptional price, and includes a four-cylinder engine and shaft drive. The examples embodying motor cycle practice, and comparing more closely with the sidecar combination, are not far removed from the price of the latter—the neighbourhood of £200. A decision to select the alternative to the sidecar does not invariably carry with it, as it did of old, a necessity for a deeper dip into financial reserves.

The three-wheeled light car on motor cycle lines may therefore be said to appeal with direct force to the motor cyclist, and the examples of this type of machine at Olympia should give rise to considerable interest. As regards speed and hill-climbing abilities there is little, if anything, to choose between the best examples of the two types, while in cost of running it is questionable whether one holds an advantage over the other.

Engines.

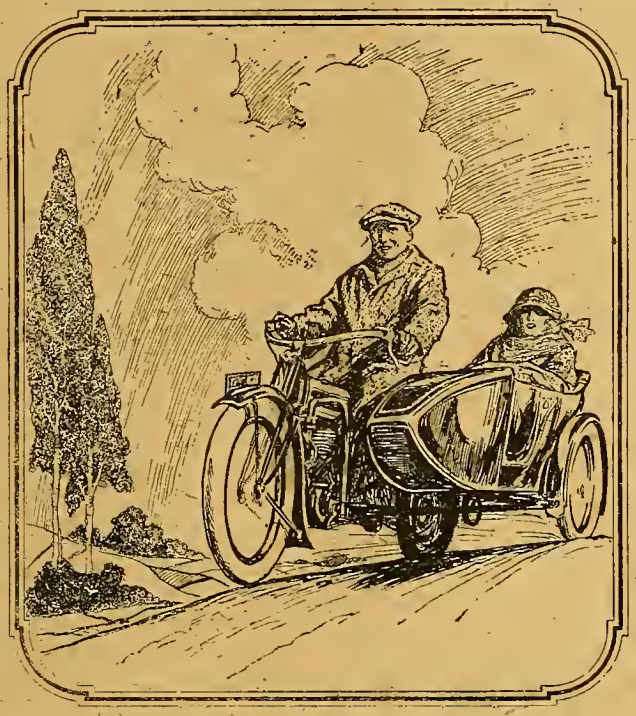
Reviewing the outstanding characteristics of the runabout—as the three-wheeler of the type in question is called—the prevailing practice is to use a V twin engine of 8 to 10 h.p., the result frequently being a replica of the power plant standardised for sidecar machines. It occurs with both air-cooled and water-cooled cylinders, and has proved quite as satisfactory in the simpler form as the air-cooled twin engine on motor cycles. But water-cooling can be provided much more conveniently on the runabout, and the scales are not so weighted against the system as they are in the alternative type of machine. Air-cooling has undoubted points in its favour, of which simplicity is not the least important. Water-cooling, however, has advantages, and personal opinions vary as to which is the better proposition all round. The water-cooled engine is not so prone to "konking" as the other, and is less liable to overheat. But under certain conditions, and at certain times of the year, it causes the cylinders to be kept cooler than is desirable from an efficiency point of view. The best working temperature of an engine is well above the boiling point of water, and yet 212° Fahrenheit is theoretically the highest temperature a water-cooled engine can attain.

As suggested already, one example of the runabout at Olympia has a four-cylinder engine. This is a water-cooled type on car lines, with thermo-syphon water circulation.

The engines of these machines are invariably placed in front under a bonnet, and have their crankshafts set longitudinally in the frame. At some point in the transmission, therefore a right angle drive is necessary, and, unless a complete shaft drive is adopted, the bevel gears that are generally used must occur in front of the final transmission unit. But this point will be referred to later.

Engine Lubrication.

The most frequently adopted lubrication system is that embodying a hand pump, with or without a sight-feed drip, with splash from the crank case. But in one instance, a fully forced system is used, the oil



Concentrated in One Type.

THE TRIUMPH reputation is built on three solid facts. The TRUSTY TRIUMPH was a pioneer—the father of the big single. From the earliest days the magnificent quality of material and craftsmanship has been jealously maintained. From the first we have concentrated on one type of engine, the no-trouble single.

Those facts explain the present day reputation of the TRUSTY TRIUMPH. They explain why the TRIUMPH has never lost its grip of the market — and **why it never will.**

Three-wheeled Runabouts at Olympia.—

being led through a drilled crankshaft to the main and big end bearings. One engine—the four-cylinder already referred to—has a sump for a large supply of oil below the crank case proper, and a pump draws lubricant therefrom, and delivers it to constant level troughs arranged under the big end bearings, and into these the latter dip at each revolution of the crankshaft.

Clutches.—The cone type, faced with leather or fabric, is most widely in use; but the multi-plate pattern is represented. Pedal operation, as in car practice, is invariable.

Gear Boxes.—Sliding gears are in the majority, though in the best known example of the runabout—the Morgan—the gears are changed by meshing one of two pairs of dog clutches; but then the Morgan has not a gear box in the usual sense, as the two ratios of transmission are provided by the duplicated final chain drive. One machine has an epicyclic type of gearing, giving two speeds forward and a reverse: the latter, by the way, being in evidence in all the recently designed runabouts. Epicyclic gearing is not novel in motor cycling practice, for the hub type of variable gear embodied the same principle. But in the runabout in question the gear box is a separate unit, somewhat on the lines of the Ford car gear, the low speed being brought into use by depressing a pedal, which, when released, allows the clutch and top speed to be engaged; neutral is the mid position, where the pedal may be held by partially or fully applying the hand brake. The reverse is obtained by depressing a second pedal; this also serves as a transmission brake.

Complete Transmissions.

If we consider details minutely, it may be said that no two runabouts have the same systems of transmission from engine to rear wheel. But they may be roughly arranged in three classes:

1. Shaft, bevel, and chain.
2. Shaft, spur gears, bevel, and chain.
3. Shaft, spur, and bevel.

The last is really an all-shaft drive, for on top gear the drive is direct, without intermediate gears in use, from the engine to the bevels on the wheel. The Morgan is the protagonist of No. 1, while the Premier and L.S.D. are in the second class.

Wire spoked wheels predominate, though the pressed steel type of artillery wheel has appeared in its detachable form. The question of rear wheel detachability and the interchangeability of all the wheels has received close attention. In several cases there is no need to touch the chain adjustment, brakes, or brake adjustments to remove or replace the rear wheel. Knock-out spindles are generally used to attain this very desirable end.

Quarter-elliptic springs of the leaf type are very popular, and only one machine at Olympia did not use this kind, either at the back or front, or both. But coil springs within the steering pivots occur in three cases in front, and a pair of semi-elliptics, one each side of the back wheel, obtain in the new Castle runabout. It is pleasing to note that more careful consideration has been given to stiffening up the rear part of the frame and suspension to provide greater lateral stability, and to the matter of centralising the pivot axes of back forks, chains or shafts, and rear springs—the vertical movement of the back wheel allowable by the springs should not result in imposing longitudinal stresses on shafts, chains, or springs themselves. Brake adjustments, also, should be unaffected by spring flexion, and the final rods should be centred at their front ends on the same lateral line as the rear fork axis.

Brakes.—With one exception only, the two brakes invariably take effect upon the rear wheel hub; but arrangements differ, both in regard to the placing of the brakes and in the type of brake used. Band brakes occur both on one side and applying to the same drum, and, alternatively, to a drum at each side of the wheel. The Premier, on the other hand, has two sets of internal brakes on the same side, and more consideration than usual has been given to rendering the adjustments accessible.

Chain Protection.—It is disappointing to find that all the makers using a chain or chains for the transmission have not given more attention to the protection of the chains. But this criticism can certainly not apply to the runabout mentioned in the last paragraph, for the chain is fully enclosed in an easily detachable case, but is, nevertheless, readily adjustable.

Steering Systems and Frame Construction.

Steering.—Four types of steering gear are in evidence: direct, rack and pinion, worm and sector, and epicyclic. All have car type wheel control. The direct type has a lever at the lower end of the column, which acts directly upon the rod leading to the coupled steering pivots. This type may be deficient theoretically, but in practice it has proved successful.

Frames.—Tubular, pressed steel, and ash reinforced with flitch plates are the three types of frames in evidence, and so long as the principle is carefully worked out, each has points in its favour. But the pressed steel variety has eliminated the others in car practice, and there is a probability that it will eventually be the survivor in runabouts. The first costs in manufacturing are higher, for there are special dies to be made; but afterwards it becomes a simpler proposition, low in cost, convenient for supporting the engine and gear box, and without disadvantage to the user.

General.—Crude though the original runabouts were, design has gradually but obviously improved, and as practical machines for everyday use they are at least the equal of the sidecar combination, possessing, in respect of passenger protection, points in their favour that cannot find their equivalent in the more prevalent two-passenger motor cycle. The advent of the readily detachable and interchangeable rear wheel has removed an objection that previously had weight, and the carrying of a spare with fully inflated tyre puts the user in a position equal to that of the car driver, so far as punctures and bursts are concerned.

One objection is sometimes raised against the runabout, and that is, its three tracks, which make it difficult for the driver to "straddle" pot-holes and loose stones. But this drawback is, to a large extent, counteracted by the excellent systems of all-wheel spring suspension that are in evidence in one form or another.

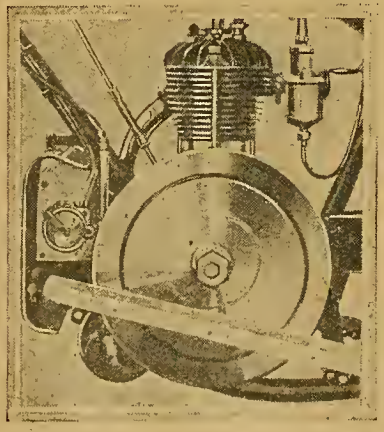
PROPRIETARY ENGINES AT OLYMPIA.

A Survey of Engine Units to be marketed in 1920.

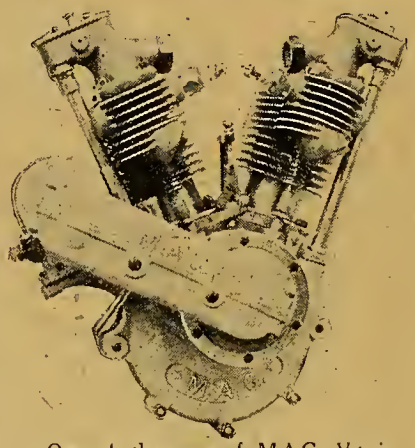
SOME of the best features of engine design seen at the Show were found in component power plants constructed by firms which specialise in their production. It is interesting to note that the adoption of a standardised unit has always been a characteristic of a great many motor cycles, and this policy is being now taken up very widely by car manufacturers. It is undoubtedly a sound one, as through specialisation and the fact that large outputs are handled, economy in cost and efficiency in the service of spare and replacement parts are simultaneously obtained.

Blackburne.

The Blackburne engines were found on several stands, and it is safe to say that no single motor has had a more salutary influence upon motor cycle engine design, especially in the direction of outside flywheels and efficient valve cooling. There are three types—singles of 2¾ and 4 h.p. and an 8 h.p. twin. In each case the head is separate from the cylinder barrel, thus minimising any distortion due to unequal expansion. The method of holding down each cylinder by three bolts is admirable in every way. Each bolt has a hexagon shoulder towards its lower end, which forces the flange at the foot of the cylinder hard up against the crank case. The extension of each bolt passes through the cylinder head, which is secured by ordinary nuts. This method of attachment is simplicity itself, and has the advantage that the removal of the cylinder head, which comes away completely with the valves, in no way interferes with the cylinder itself, which latter, in the ordinary course of events, requires to be removed very seldom. The accompanying sketch illustrates the arrangement of the bolts, and also shows the thorough manner in which the valve pocket is furnished with cooling fins. Webs are cast across the exhaust valve cap to enhance radiation. The tappet adjustment will be noted. In this the two hexagons are placed sufficiently far apart to enable ordinary spanners to be used without difficulty, a point which will be appreciated by the practical rider. Another neat item of design is the making of the inner part of the magneto chain case in one casting with the timing gear cover, whereby the engine is made much neater.



The single-cylinder Blackburne engine, with outside flywheel



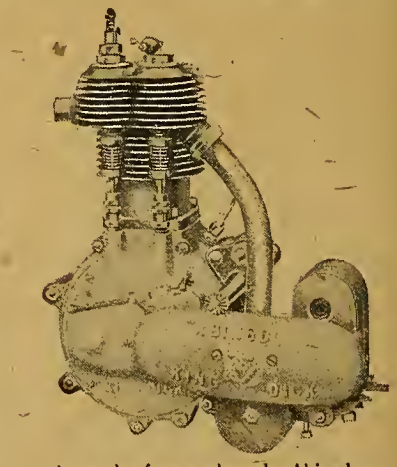
One of the range of M.A.G. V-twin engines, which, as will be observed, has overhead enclosed inlet valve mechanism, lubricated automatically from the crank case

Abingdon-Ecco.

There were two well-constructed types of Abingdon King Dick engine—a 3½ h.p. single, 85×88 mm., and a 6-7 h.p. twin, 73 × 95 mm. In general design they are on similar lines; but whereas the single has its crankshaft supported on ball bearings each side, the twin shaft is furnished with a double ball race—four rows of balls in all—on the driving side and a plain phosphor-bronze bush on the timing side. This bush plays an important part in the lubrication system. At its outer end it is hollowed out into an annular ring into which oil is fed from the sight feed. Inside its bore it has a helical groove, and the rotation of the shaft causes the oil to be driven along this. On emerging, the oil is thrown out by centrifugal force to a circular gutter in the flywheel, whence it passes to the big end bearings. Ducts are provided, so that the oil mist in the crank chamber is directed to the timing gear, and keeps this last constantly lubricated. An interesting point is that if occasion should arise for the engine to be given an extra supply of oil, this first fills the annular chamber in the crankshaft bush, but the rest, without having to pass through the bearing, goes directly to the crank pin, whence it is flung on to the cylinder walls. In other points of design the Abingdon-Ecco engines follow conventional lines, though in many details originality is shown. For instance, the tappets are fitted with hardened steel rollers. The pistons are of the plain cast iron type, with two rings at the top, one at the bottom and a wide guard ring over the gudgeon pin in the middle of the piston waist.

M.A.G.

No engines enjoy a higher reputation, especially for perfection of workmanship, than the famous M.A.G., of which two models are made, both twin-cylinder, of 3½ h.p. and 6 h.p. respectively. The former has a bore and stroke of 64×77 mm. The general lines of M.A.G. design are well-known, and these have not been departed from in the 1920 models. The great feature of the engine is its use of an overhead inlet valve, in which the whole of the operating mechanism, including the rocker and the vertical tappet rod, is entirely enclosed. The accompanying sketch illustrates the scheme. The inlet valve complete with its mechanism is readily removable. The great advantage of this design is the effectual manner in which grit or moisture is prevented from reaching the tappet mechanism. Since this is entirely encased, it receives lubrication from the crank case to keep it in perfect condition; its noiselessness of working is much enhanced. The exhaust valves are operated in the usual



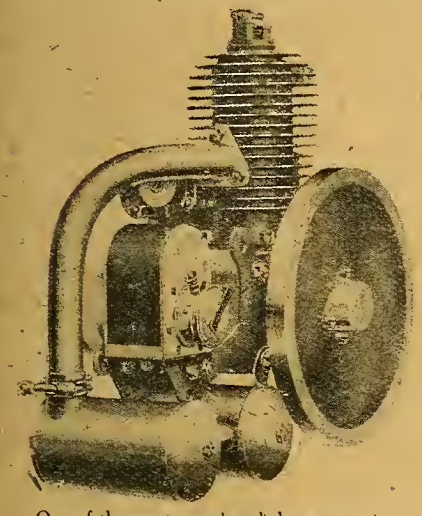
A popular four-stroke—the Abingdon King Dick.

Proprietary Engines.

manner. The magneto is chain-driven, and, instead of being held down on to its platform by the usual set screws, is clamped in position by two long bolts passing through the extremities of an aluminium bridge piece.

Villiers.

The Villiers two-stroke motor cycle engine is one that has long established a high reputation, and a very excellent design it is, as is well proved by its

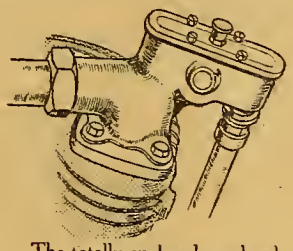


One of the most popular of the two-stroke power units—the 2¾ h.p. Villiers.

popularity, for it was to be found on a large number of stands in the Show. It has the usual arrangement of ports, transfer port at the rear, compression release valve on top of the cylinder head, and the inlet port with Amac carburetter socketed into it at the side. The exhaust port is at the front, and the exhaust pipe, in some models, is swept outwards and downwards, with a rather sharp corner, to avoid the frame down tube. On some machines a double down tube is used, and in this case a straight exhaust pipe can be fitted which passes between them. The sketch illustrates the unusual care which has been bestowed upon the silencer arrangements. The two expansion boxes are "in series," and are carried under the crank chamber, for which they form an effective undershield. The final exhaust pipe will be noted. This double silencer is very neatly and effectively made, and is an admirable feature of an admirable little engine. The lubrication is upon simple yet efficient lines, the oil being delivered from the pump to one of the crank chamber bolts, which is hollow, and whereby it is passed directly to the thrust side of the piston. The outside flywheel is of large diameter.

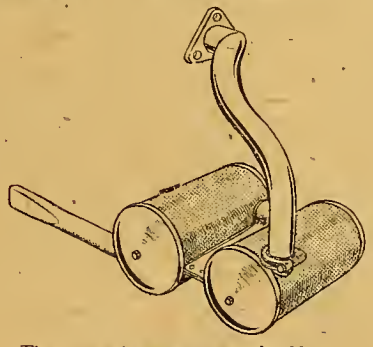
Precision.

In addition to the 8 h.p. twin, the design of which is well known, and calls therefore for no particular comment, Precision engines for 1920 comprise a very neat 359 c.c. two-stroke, which has a bore and stroke of 74×81 mm. This is the type of engine which is fitted in the interesting new Beardmore-Precision motor cycle. The design is up-to-date in every respect, the big end having large diameter roller bearings. The most outstanding feature of the motor, however, is its unique lubricating system. A supply of oil is carried in the crank chamber sump, and is circulated by the



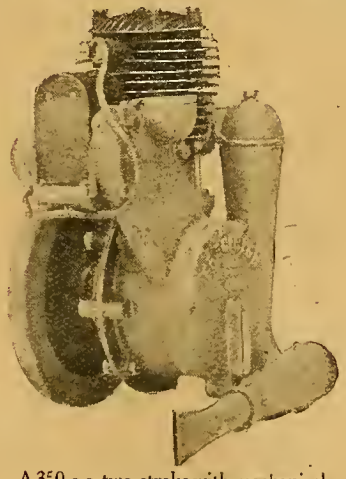
The totally enclosed overhead valve mechanism of the M.A.G. 4 h.p. engine

magneto driving chain, which dips into the sump and lifts the oil up to a filter chamber cast on the chain case. After passing through a filter, the oil proceeds through an adjustable valve to the engine, every part of which it lubricates before dropping down again into the sump and being again put into circulation. It will



The twin exhaust boxes on the Villiers two-stroke power unit.

be remarked that this exceedingly clever system calls for no additional working parts whatever. It may be added that

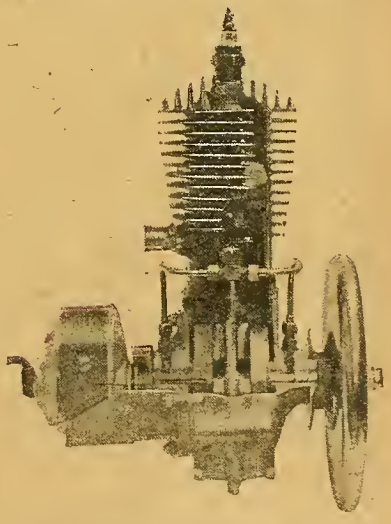


A 350 c.c. two-stroke with mechanical lubrication—the Precision.

the engine alone is sold and not the integral gear unit incorporated in the Beardmore-Precision machine.

Union.

The Union two-stroke engine is a modern power plant on which it is clear that much careful thought has been expended. Examination of its details indicates that in no way has the construction been skimped, but that rather a new standard of efficiency has been sought. A good point is that the exhaust port is slightly to one side of the cylinder barrel, thus facilitating the mounting of the engine in the frame, as the exhaust pipe does not have to be bent at a sharp angle to escape the down tube. The crank case is of the pill-box type, with a detachable end plate which carries a webbed extension forming a bracket for the magneto. The latter is driven from the crankshaft directly, and without the intervention of chain or gearing. An unusual feature is that the transfer port, which is at the rear side of the cylinder, is cast with its top end open, so that the port itself can be smoothed out and shaped, the opening being covered in subsequently with an aluminium plate. The crankshaft is of the two-bearing type with balance weights, and is an excellent piece of sturdy workmanship. The lubrication system is very thorough. Oil led to a distributer on the cylinder, whence it passes, first, directly to the thrust side of the piston, and, secondly,



One of the several complete power units at the Show—the Union, a model produced to meet the demand for lightweights

to each main bearing. The compression release valve delivers by a short branch pipe into the main exhaust pipe.

Victor.

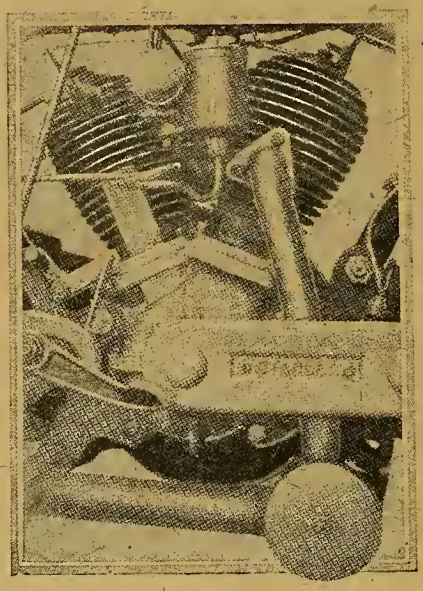
A new proprietary engine is the horizontally-opposed Victor of 5-7 h.p. In general, it follows conventional lines, the offset being quite small and the cooling ribs running parallel with the cylinder axis. The timing case is of pyramidal shape, and is carried on the top of the crank chamber. The valves, which are over the cylinder and are not inclined to its axis, are side by side and interchangeable. Screw-down priming cocks are provided half-way down the cylinder bore. The engine is designed to be supported on two parallel tubes, which pass through

Proprietary Engines.—

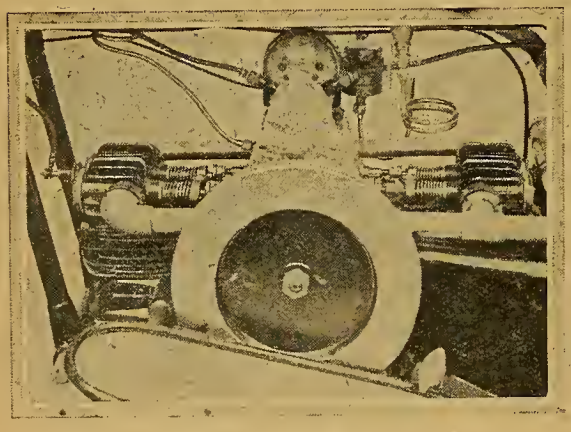
grooves cast in the crank chamber bottom half, and this certainly provides a very neat form of mounting. The outside flywheel is of good diameter. The magneto is mounted on the top of the timing case and is gear driven. The carburetter is placed on the top of the inlet pipe, and is of a curious inverted pattern. The exhaust pipe passes between the flywheel and the cylinders, and although the front cylinder discharges into it through a curved portion the rear cylinder exhaust enters it through a short right angled pipe.

Stanger V Twin Two-stroke.

In the issue of November 20th there appeared a full description of the Stanger two-stroke engine. Multi-cylinder two-stroke engines are comparatively rare on motor bicycles, and so the exhibit under notice did not fail to attract attention. The engine is a V twin of the three-port variety, the radiating fins are of large dimensions, and the cylinders are placed in a staggered position on a double aluminium crank case and are set at 45°. Every effort has been made to avoid rough places in the cylinders and so prevent carbonisation by machining their entire interior. Cast iron pistons of the deflector type are used with two rings at the top and one at the skirt. Hollow gudgeon pins are fitted. The two-throw crankshaft is hollow and made in one piece. It is composed of 50 ton case-hardened steel, and the cranks are set at 180°. It runs on double self-aligning ball bearings, and compression is retained by means of special compression-tight bushes. As the crank case is divided into two portions each throw revolves in a complete crank chamber of its own.



V twin two-stroke Stanger. A type of engine of which only one representative was exhibited.



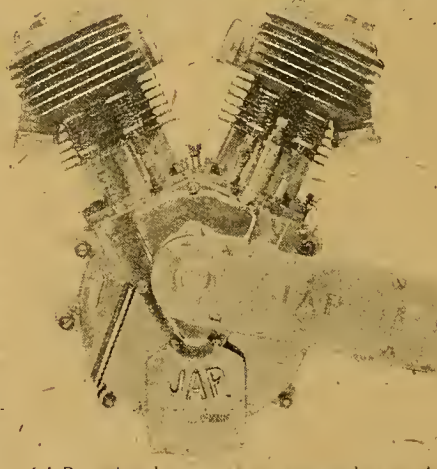
Coventry Victor flat twin

J.A.P.

J.A.P. engines may be said to have grown and developed with the pastime itself, and there is no doubt that the industry owes a great deal to them. They first saw the light in 1903, when British motor cycle engines were practically non-existent, and the then small works of Mr. J. A. Prestwich were devoted to turning out a certain number of those engines which helped to make the success of the earliest all-British motor cycles.

To-day, scarcely one motor cyclist in ten thousand is unaware of their existence, and literally thousands are in use at the present time, hence any alteration in models is of great interest to the motor cycle fraternity.

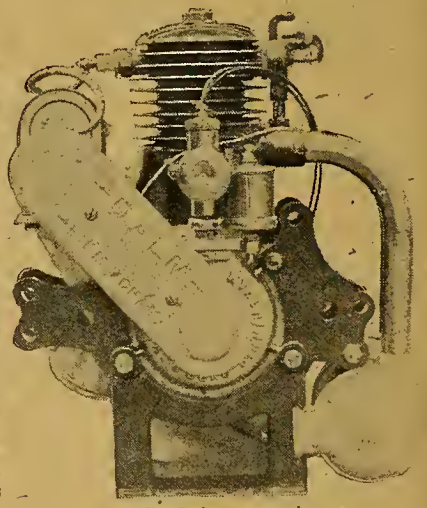
The improvements which have been incorporated in the latest models include the lightening of the distribution and tappet gear, which is now only half the weight it was previously. Particular attention has also been given to the valves, which are made from a steel of a particular specification. It is not generally realised that the J.A.P. system of lubrication is a genuine force feed, but this is actually the case, and the crank case compression is utilised in a most ingenious manner to force the oil to all the principal bearings. In the later models the design has been slightly modified, one of the most important improvements being the increase in size of the oil chamber cast integral with the crank case of these engines. The pistons are now fitted with narrower and lighter rings, while the gudgeon pin bearings have been increased in size from $\frac{1}{2}$in. to $\frac{5}{8}$in.



J.A.P. engines have a reputation extending to the early days of the motor cycle.

We have already made reference in these pages to the $2\frac{3}{4}$ h.p. single-cylinder, formerly known as the $2\frac{1}{2}$ h.p., which is now equipped with a chain-driven magneto, a perfectly oil-tight timing gear case, two bearings to the cam wheel spindle instead of one, an internal exhaust valve lifter and adjustable tappets. All bearings have been enlarged.

The range of engines which Messrs. J. A. Prestwich are now manufacturing includes the $2\frac{3}{4}$ h.p. single-cylinder, 70×76 mm.; 4 h.p. twin, 70×64·5 mm.; 4 h.p. single, 85.5×85 mm.; 5 h.p. twin, 70×85 mm.; 6 h.p. twin, 76×85 mm.; and the 8 h.p. twin, 85.5×85 mm., which may be had either air or water-cooled. J.A.P. engines *per se* were not shown at Olympia, but numerous examples of them were found on different makes of motor cycles throughout the Exhibition.



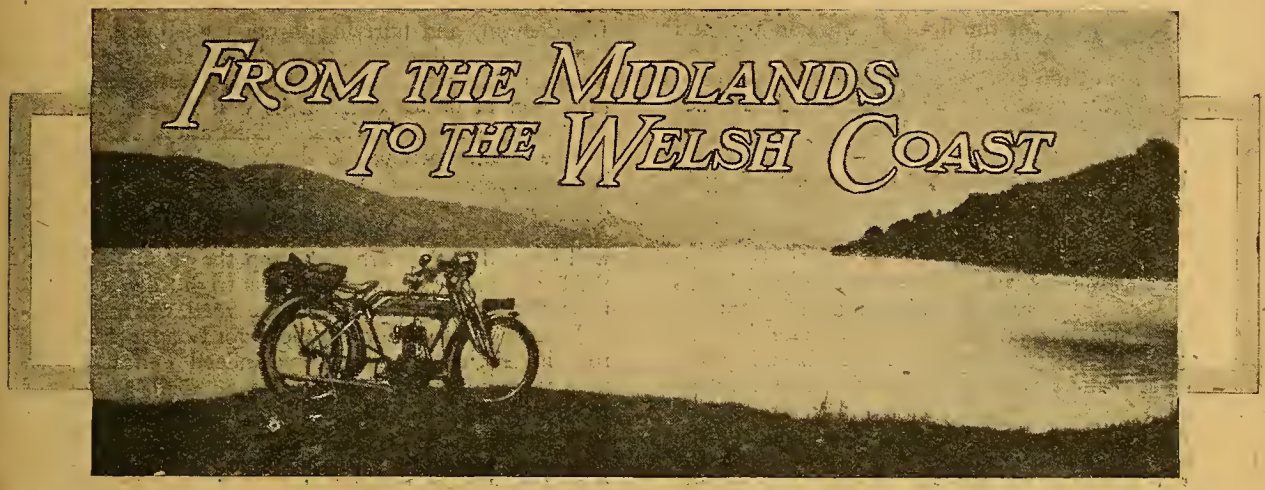
The Dalm two-stroke.

Dalm.

It is hard to conceive a more simple straightforward design than that of the Dalm, two-stroke engine. A one-piece crankshaft runs in plain phosphor bronze bearings lubricated through ducts from a well round the base of the piston. The engine is of the three-port type, and has two exhaust pipes leading directly from the cylinder to the silencer. This arrangement avoids the sharp bend in the pipe so often necessary to clear the frame tube, and gives a free run to the gases.

Cast with the crank case is a platform for the magneto, this unit being placed behind the cylinder and driven by an enclosed chain.

Balance weights are riveted to the crankshaft, and the gases from the exhaust release valve are led directly into the exhaust port casting.



A Short Trip into North Wales on a Sporting Solo Mount.

THE touring department of *The Motor Cycle*, which deals with the recommendation of routes, received so many enquiries regarding the state of the roads in North Wales that during the holiday season it was considered advisable to obtain some first-hand knowledge thereon.

Accordingly, we planned a sketchy route with the idea of covering as much of the district as possible in the short time available—and so, armed with camera and notebook, we set out from Coventry a little before three o'clock one bright afternoon, mounted on a 3½ h.p. T.T. Norton.

No very hard and fast schedule (or even destination, for the matter of that!) was decided upon—the chief object being the finding of the bad patches and the best roads from the Eastern Midlands, avoiding the larger towns as far as possible.

The Road Across Middle England.

Watling Street, worthy monument of Roman engineering, stretching its unbroken lengths across the face of England in such a proud and uncompromising way, was the first objective, and was reached by way of Stonebridge and Castle Bromwich.

From Chester Road to Brownhills, where the Roman road is really entered, the surface was far from good, being bumpy and loose, and again near Cannock the same discomforts were met; but the "street" has its advantages in the form of long straight—dare we suggest it?—speedways singularly free from towns, for, while it is within easy reach of the Black Country and the district around Stafford, one has an uninterrupted run from east to west, Wellington being neatly skirted, until the picturesque streets of Shrewsbury are reached.

Let the traveller be content with the assurance that Shrewsbury *is* picturesque if he has any desire to pass through the town non-stop on a clutchless mount at 6.30 in the evening on market day, as we did. The main street has no mean gradient, and there is a policeman at the end of the town round whom one must do a right angle as neatly as one dodges the bottles in a skilful driving competition at a gymkhana.

Oswestry is quickly reached, and hereabouts the scenery is typical of the foothills surrounding most mountainous districts, rolling and undulating country separating the level plain from the rugged contour of the far distance; the main road through Oswestry and for a few miles beyond was decidedly bad, but it could be avoided by keeping to the right at the Queen's Head Hotel, about fifteen miles beyond Shrewsbury.

At Chirk a sharp rise is encountered as the River Ceiriog is crossed, and the bends are sufficiently acute to prevent one getting anything but a fleeting glimpse of the imposing double viaduct visible higher up the valley; this was the first real hill of the journey, and shortly a left turn was made into the beautiful Vale of Llangollen.

The valley is quite narrow, and is hemmed in by serried peaks of varying altitudes, which, rising from the road in places with steep and unbroken slopes, give an effect of mountainous surroundings to a much greater degree than in many less confined areas of greater elevation.

Winding along with the course of the Dee the road is one presenting prospects of ever-changing interest, and, although somewhat sinuous and demanding care on the corners, the surface was good, and if the pace be kept moderate there is scenery on every hand worthy of admiration; over to the right, as the vale narrows, may be seen the ruined castle of Dinas Bran at the crest of a minor conical peak, which standing against the dark mountain background in the light of the setting sun, as we saw it, made an impression of almost theatrical vividness.

The Vale of Llangollen.

Passing through Llangollen with regret that time would not permit a stay here, we quickened our speed into Corwen, where the first stop was made for a very excellent meal at the Owen Glydwr Hotel.

From Corwen to Bala there is a choice of two roads, and, as we always prefer the route which gives promise of the best scenery, we naturally chose the one which runs nearest to the water and the mountains instead of that which branches to the right and crosses the Dee just outside the town.

Running into Bala just on nine o'clock, we decided to stay the night, and spent the last hours of daylight by the shores of the lake, which opens out before one almost as soon as the town is left behind. The

From the Midlands to the Welsh Coast.—

sight is probably one of the finest in the country, and the photograph at the head of this article can give no real impression of the blue waters reflecting the clouds, rose-tinted by the after-glow of the departed sun, nor of the pearly greyness of Aran Mawddwy rearing its head in the distance.

Morning brought a shower, but the sun smiled again as we got on the road.

Mountains, River, and Sea.

Quite a steady pace was maintained along the banks of Bala Lake, the scenery being too delightful to permit speeding; beyond Llanuwchllyn, where the road and railway together run between Aran Mawddwy and Rhobell Fawr, the surface was somewhat loose, but no hard climbing was involved. We left Dolgelly on our left hand, and, keeping straight on, crossed the River Eden at Llanelltyd, following the road on the right of the Barmouth Estuary—surely one of the loveliest stretches of road in existence. With Cader Idris towering on the left, and the ever-widening River Mawddach before one, it only needs the strong, ozone-laden atmosphere from the blue sea, soon to come into view, to thrill the jaded pulses of townsmen fresh from sultry streets and stuffy offices.

The road surface from Barmouth to Llanaber, along the coast, was bad, but presently improved. Pausing a moment to photograph Harlech Castle for the sake of its resemblance to Mont Orgueil in the Channel Islands, we regretfully turned inland again near Llandecwyn, and hurrying through Festiniog, assailed the pass over the hills, through the slate quarries of Blaenau Festiniog. This indeed is a valley of desolation, and in winter time might well have formed the subject of a Doré "Inferno" illustration.

The surface hereabouts was stony but firm, and the hill is quite respectable as regards length and gradient (sufficiently so to require a second attempt to enable the Norton to make a clean climb with its Philipson pulley well opened out). From the top the steep descent to the lovely valley of the Lledr was frightfully loose, but from there to Bettws-y-Coed the road was perfect.

From Bettws to Corwen the main London-Holyhead road is delightfully graded, and indeed Telford's highway compares well with the Roman road, over which we came, and is in somewhat striking contrast with the roads of most other hilly districts, where the engineers have shown little apparent desire to skirt the obstacles, and assail the gradients with careless abruptness.

A Place to Avoid.

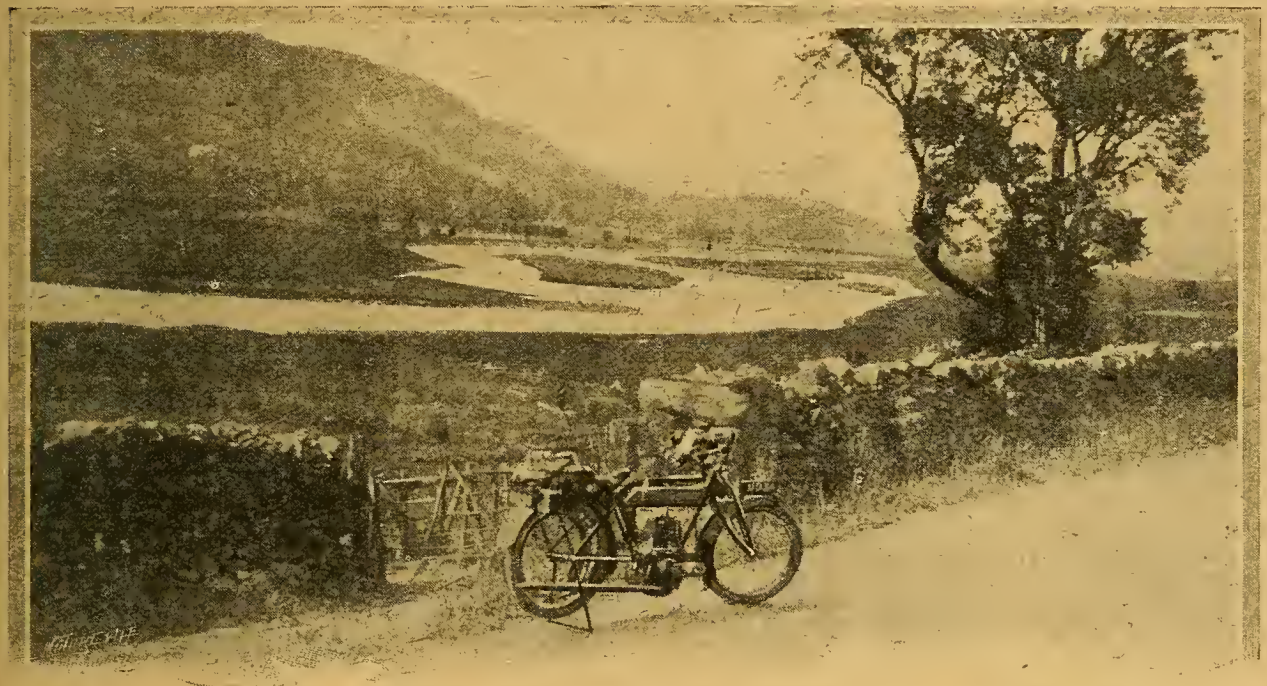
Wishing to call on a friend in Holt, we crossed the river at Llangollen, and followed the Wrexham road through Ruabon. We would strongly urge upon all and sundry the avoidance of the latter place with its three level crossings in the main street. From Holt *via* Malpas, Whitchurch, Market Drayton, Eccleshall, Stone, Rugeley, and Lichfield, the roads were all in

(Left) The mountain road beyond Blaenau Festiniog (Top) A scene near Bala. (Right) Approaching the hills (Harlech to Festiniog

From the Midlands to the Welsh Coast.—

good condition: in many parts, indeed, excellent, and good speed was maintained. At Fazeley, just beyond Tamworth, where the Watling Street is again reached, instead of crossing straight over and passing through Coleshill direct to Coventry, the writer, in a moment of forgetfulness, turned left to Atherstone, thence to Nuneaton, beyond which place a veil must be drawn over his sufferings upon the vile road surface, where, clashing from pot-hole to pot-hole in the gathering dusk, he discovered later that he had left a scattered trail of spares, tools, rear lamp, and dust-coat: indeed, all the loose impedimenta which *could* fall off with vibration did so.

Excepting this last section, the three hundred miles covered during the course of the trip were thoroughly enjoyable, and well worth the while of any keen rider.



The Dolgelly-Barmouth road; a beautiful stretch—Cader Idris above, and below the ever-widening River Mawddach which opens into the sea a few miles further on.

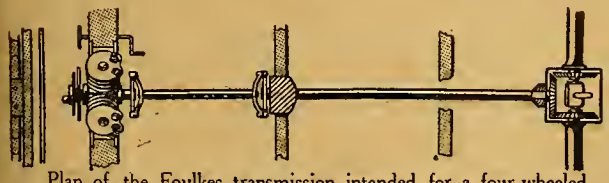
A Simple Change-speed Gear for Runabouts.

Two-speed and Reverse Chain and Shaft Transmission without Complications.

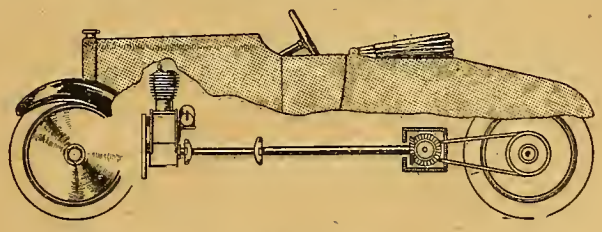
SIMPLICITY in runabout design more often than otherwise means crudity, and, although a large number of designers have striven to produce a transmission suitable for this type of vehicle, very few have fully succeeded. The Morgan transmission, probably, is the most simple form of two-speed gear, but Mr. T. Foulkes, of 145, Cobden Street, Blackley, Manchester, has patented a transmission system which may interest those who are contemplating manufacturing a runabout.

Briefly, the Foulkes system consists of the usual two ratio chain transmission embodying expanding clutches of the Enfield or P. and M. type located under the crank case, where it could be conveniently housed in a hollow steel or aluminium bracket supporting the engine. In one form a starting handle is intended to be carried on a shaft on one side of the supporting bracket, but it would not be difficult to adapt the usual Enfield handle starter to be operated from the driver's seat.

The idea is equally applicable to three and four-wheeled runabouts.



Plan of the Foulkes transmission intended for a four-wheeled runabout. The reverse is obtained by an additional crown wheel on the axle.



Side elevation showing in diagrammatic form the system applied to a three-wheeler.

French Scooter Trial.

Our Parisian contemporary, *L'Auto*, will organise a scooter trial next year. April is the month provisionally selected, and there will be a speed contest on the level, a hill-climb, and a competition for the best appearance. The French term for the scooter is *patinette automobile*.

Dangerous Cross Roads.

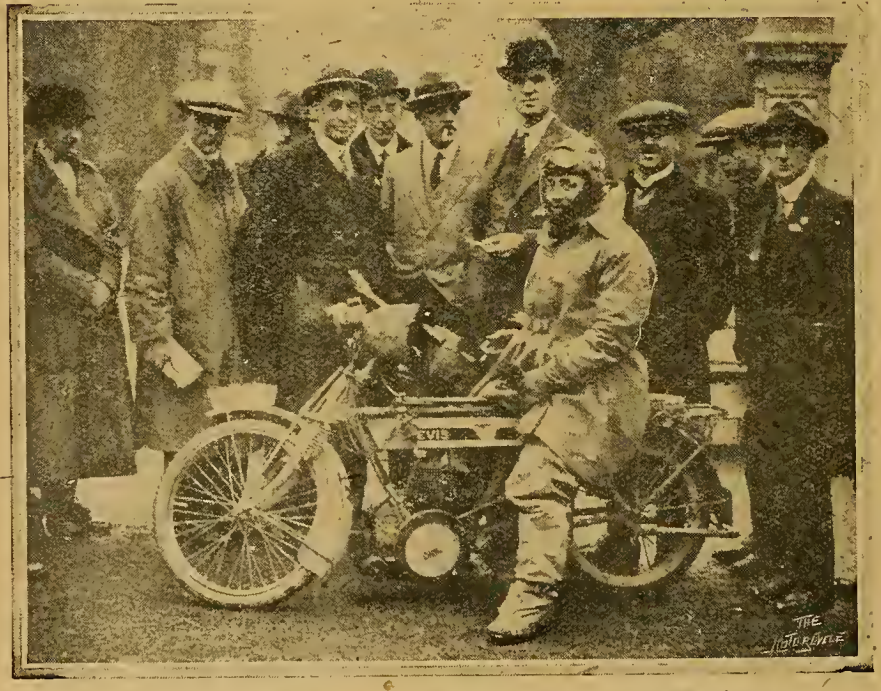
We are informed that a number of accidents have occurred at the cross roads by the "Plumbers' Arms," Limpsfield. This is a junction of the main Redhill-Sevenoaks and the London-Edenbridge roads. Motor cyclists are advised to exercise caution at this point.

The London-Exeter Run.

We understand that over forty new members were recently elected at a committee meeting of the M.C.C., who joined specially for the London-Exeter run, and it is anticipated that there will be well over 100 entries.

Catalogue Fiends at the Show.

Everyone connected with the motor cycle trade knows how difficult it is to protect himself against the assiduous catalogue collector, who has no intention of purchasing a motor cycle. Despite the still existing paper shortage, a vast quantity of literature was distributed, its most ardent collectors being school-boys, who nowadays turn those longings which were once lavished on the productions of the pastrycook towards the manufactures of the motor cycle maker. At the other end of the scale, however, one old gentleman was observed conscientiously touring the stands and filling a large haversack with every available sample of gratuitous printed matter.



G. Kuhn on the single geared Levis, with which he completed an unofficial run from John-o'-Groat's to Land's End and Olympia.

Special Features.

SOME NOTES ON SIDECARS. SHOW REPORTS OF ACCESSORIES AND ENGINE UNITS. REVIEW OF THREE-WHEELERS.

Average Second-hand Prices.

Despite the advent of the Show, with new models in the air and hopes of mass production during the coming year, there is yet no appreciable fall in second-hand values.

The only noticeable tendency is towards a distinct moderation in the prices asked for old type and obsolete models, many of which, in the spring of this year, changed hands at fabulous prices. This, at any rate, is an indication that the day is passing when anything on two wheels and possessing an engine of sorts may be sold off to the highest bidder in a queue of eager buyers. It is to be hoped that this tendency will persist throughout the winter, when it may be possible for production to overtake demand.

Machines of 1919 manufacture, after a season's use, still bring list price, or even slightly more, but the fancy figures demanded by some optimistic owners of certain American products appear to be on the decline.

The Rev. P. W. Bischoff, who has decided to abandon the ministry and enter the motor trade. Mrs. Bischoff is seen seated in the Clyno sidecar.

From the Church to the Motor Cycle Trade.

It may be said that before the war almost every reader of *The Motor Cycle* had heard of the Rev. P. W. Bischoff, who was so closely associated with competitions on the road and track. He was known as a keen Triumph and Clyno rider, and competed with success in many of the classic trials. Motor cycling was his hobby and the Church his profession. After serving with the Navy during the war, he has now decided on joining the staff of one of our largest manufacturers of motor cycles, and was to be seen on their stand during the latter part of Show week. The Rev. P. W. Bischoff has been a motor cyclist for just twenty years, and has the honour of having been the secretary of the Auto-Cycle Legion, an active body of riders called into existence by the War Office when the Government first realised the possibilities of the motor cycle as a war machine. The Legion was practically the embryo of the despatch riders and the M.M.G., who covered themselves with glory in the late war.

Mrs. Bischoff, too, is well known to all who followed the sport before the war. A very keen rider, as Miss Beatrice Langston she was the first lady competitor to win a motor cycle race at Brooklands. This was the 100 miles non-stop high speed trial organised by the B.M.C.R. Club.

New Models Coming.

Judging from the number of firms who are experimenting or preparing to produce new models, a show held in six months time would produce many more startling innovations than were exhibited at Olympia.

At the present moment manufacturers are too busy turning out modifications of their 1914 models to make alterations to their plant. On the other hand, all go-ahead concerns are at least contemplating more up-to-date designs, and many newcomers to the trade already have experimental models of advanced design under test.

An Absentee.

We regret that Mr. E. C. Paskell, well known as the proprietor of the Colmore depots, was too unwell to be able to attend the Motor Cycle Show. His communication finishes: "You can bet I appreciated *The Motor Cycle*, but I do so keenly regret not seeing the Show. Kind regards and congratulations on your fine issue."

Tank Corps M.C.C. Trial.

A sporting trial among members of the Tank Corps Gunnery Camp at West Lulworth, Dorset, was organised to take place yesterday, the 3rd. At the time of going to press we understand that an entry of about forty had been received, and that there was every promise for a successful event. One of the prizes is a cup awarded by *The Motor Cycle* for the most plucky performance in the race of adversity, an award to the man instead of the machine. In modern trials the competitor who has the best machine has the greatest chance of winning the chief award. *The Motor Cycle* idea is to encourage the man who has ill-luck but "carries on" in spite of it.

The Tank Corps was originally recruited by *The Motor Cycle*, and the majority of its present members are enthusiastic motor cyclists, who should make competition very keen.

A Story of Show Literature.

A certain accessory manufacturer, who deals mostly with the trade, prepared a Show folder embodying some exceedingly attractive pictures, and the first day's experience told him that these were being taken up at a rate which would soon exhaust his stock. Fortunately, a plan suggested itself. Recollecting that a large consignment of annual reports of his local Chamber of Commerce had been given to him for distribution, he got these to Town and placed large piles on his stand, keeping his own matter further back. The ruse was absolutely successful, and there was much amusement amongst those in the know as the "catalogues" were seized by the souvenir hunters.

Reunions.

Olympia was the scene of many reunions. Not only did D.R.'s and M.M.G.S. arrange many gatherings, but with the exception of the A.C.U. Six Days Trials there has been no congregation of motor cyclists to approach the Motor Cycle Show.

Even those who are in constant touch with the trade met many old friends whom they had not seen for the past five years.

M.C.C. London-Exeter Run, Dec. 26-27.

A large entry has already been received for the London-Exeter run organised by the M.C.C. The event, which is an annual one, only interrupted by the war, will take place as heretofore on December 26th and 27th, and is of a thoroughly sporting nature. It will be observed from the subjoined list (complete up to November 28th) that there is no lack of hardy souls willing to essay a journey which is usually enlivened by every variety of winter weather conditions.

Mr. B. Alan Hill, the hon. sec., of Apsley, Fellows Road, Farnborough, would be glad to hear from any motor cyclists willing to act as marshals and observers.

A New Tandem Sidecar.

A Two-seater produced to Meet the Requirements of the Family Man.

FOR the family man of moderate means, the motor cycle with a double-seated sidecar meets all requirements, even if four adults constitute the family party, and the number of motor cycles now on the road with such a load are a standing tribute to the utility of the motor cycle, the strength of the framework, and the power of its engine.

One of the latest two-seated sidecars to be introduced is the "Luxurette" attachment, made by Messrs. Calland, Lee and Co., of Flint Street, Clayton, Manchester. Unlike many tandem seaters, in the "Luxurette" an exceptionally long appearance has been avoided, and when the body is empty, it is not immediately apparent that it is a two-seater. The construction includes an ash frame, panelled with three-ply birch and upholstered in a good quality leather cloth. Back and seat cushions of the main seat are sprung, and the forward passenger is accommodated in an adjustable bucket seat. The weight of the body is approximately 60 lb., and the price of the complete sidecar is 33 gns.

The Luxurette is one of the very few double-seated sidecars which looks compact, and it is excellently finished in all respects.

A double-seater sidecar of recent design produced by Messrs. Calland and Lee.

Extending the Scope of the Sidecar.

Trade Carrier and Passenger Requirements fulfilled by the Same Body.

MANY small tradespeople who find the need for a light delivery vehicle in connection with their business have considered the sidecar outfit as a suitable medium for their purpose.

Apart from its obvious advantages, such as ease of handling and storage, as well as low cost of upkeep, there is the additional fact that the same vehicle is always available at week-ends and holiday times as a passenger machine, the usual procedure being to use two bodies, one of the usual type, and one for the carriage of goods.

In order to obviate the waste of time and accommodation which this method entails, Messrs. Simkin and Aldous, 13, Croft Road, Coventry, have registered a body design which will answer the dual purpose. The body is very roomy, and has a wide front quite free from interior upholstering and trimming.

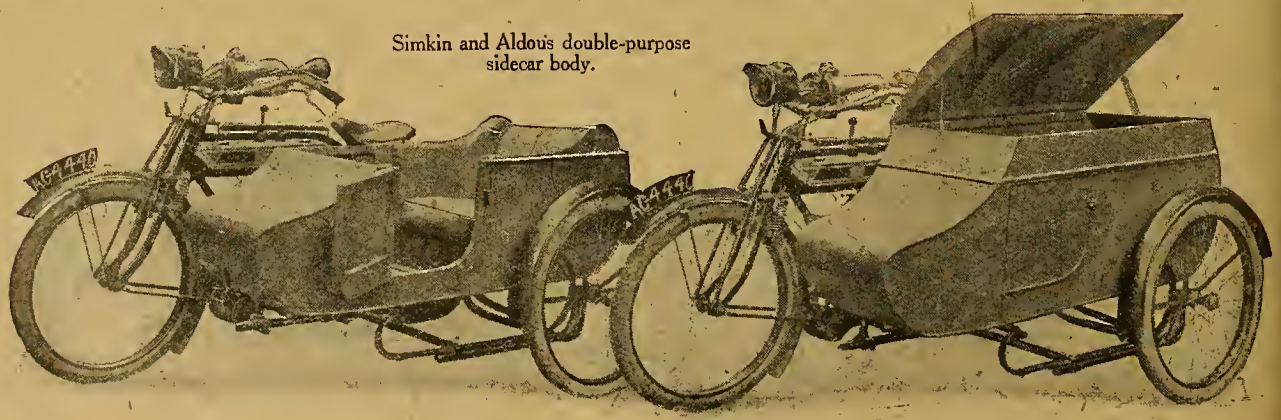
Chair Lifts Out.

At the rear is a well-padded seat, with sides and back in one unit, secured in position by locating pieces which rest against the side posts of the body. On lifting out the seat, the inside of the car is left entirely clear of obstructions or fittings liable to be damaged by merchandise.

A detachable top, secured in position without tools, and having a hinged lid, covers the whole of the body; when this is in position the side door may still be opened, a distinct advantage in wet weather when dealing with goods easily damaged by rain. For purposes of transport the seat can be placed inside the body, even when the cover is fitted.

Both as a passenger and a commercial vehicle, the Simkin and Aldous presents quite a good appearance, and is exceptionally roomy.

The body is made to suit any modern underslung chassis which is free from diagonal stays, and at a later date the makers hope to sell it as a complete sidecar, the convertible body being mounted on a chassis of their own design.



Simkin and Aldous double-purpose sidecar body.

THE T.T. RACES.

Three Classes and No Weight Limit.

THE 1920 T.T. races will be held in the Isle of Man on Wednesday and Friday, June 16th and 18th. At first it was considered desirable to drop the Senior Race for 500 c.c. machines next year, owing to the dangers of the course with such fast machines. The two events proposed were the 350 c.c. and the new lightweight 250 c.c. race, but last Tuesday the A.C.U. leaders entertained to dinner a number of trade representatives, when an informal discussion took place. The manufacturers' feeling veered toward a repetition of the classic 500 c.c. event, notwithstanding the fact that many former adherents of the 500 c.c. engine have now migrated into bigger classes. The proposals were that the 350 c.c. and 250 c.c. machines race together. A race for lightweights created great interest.

A former rule which would prove an obstacle to entries next year is to be waived. We refer to the necessity for manufacturers listing and selling machines entered for the race.

The Present Position.

The A.C.U. will reconsider the T.T. programme and again consult the manufacturers if necessary. But in all probability the events will be :

A SENIOR RACE for machines up to 500 c.c.

A JUNIOR RACE in two classes run concurrently : *(a)* for 350 c.c. machines, and *(b)* for 250 c.c. machines.

It is probable after all that maximum weights will be abandoned, though we regret that this may be the case. It is felt in some quarters that tyre sizes for instance would be sacrificed in order to reduce weight, but this can be guarded against, and, in any case, no one ever heard of a long distance T.T. race being won on doubtful or flimsy tyres.

The A.C.U. Competitions Committee will shortly reconsider the whole matter of the T.T., when final details will be decided.

Taxations.

Knowing that the taxation of motor vehicles will shortly be revised, the Motor Legislation Committee has suggested that taxation should be as far as possible proportional to the use of the vehicle taxed. That the taxation of motor spirit is the most practical method, and that there should be a flat rate of 4d. per gallon import duty on all imported motor spirit used by mechanically propelled road vehicles of every description. They further suggest that the existing basis of taxation for motor cycles and private cars should not be altered.

It was decided that if any annual charge on motor cycles was to be retained it should take the form of a wheel tax on all road using vehicles of, say, 2s. 6d. per wheel, such tax being a fee to use the road for the year from the date of payment.

Additional Premises.

The A.C.U. has taken additional premises at 83, Pall Mall, S.W.1., on the floor below its existing offices.

THE JUNIOR CAR CLUB DINNER.

THE first annual dinner of the Junior Car Club was held in the Great Gallery of the R.A.C. on Thursday evening last. Dr. A. M. Low, D.Sc., was in the chair, and, after proposing the toast of "The King," he rose to propose the health of the visitors, and regretted the absence of several distinguished people who had promised to be present, including Gen. Sir John Nixon, Mr. Charles Jarrott, O.B.E., Gen. Cadell, and Sir Henry Norman. He coupled with the toast of "The Visitors" the name of Mr. H. Massac-Buist.

Mr. Massac-Buist, in his reply, spoke at some length on the future of the light car, in which he had the fullest confidence.

Sir Julian Orde was then called upon to present the prizes won during the various competitions held during the past season.

Among the awards two were given to riders of the type of cycle car with which this journal deals. In the general efficiency trial a gold medal in Class I. was won by E. A. Tamplin (Carden Monocar); in the second class by H. S. F. Morgan (8 h.p. Morgan).

THE PARIS-NICE TRIAL, FEBRUARY 13-14.

WE are able to give further information concerning the Paris-Nice trial to be held between the above-mentioned dates. Cups will be given by *Le Petit Journal, Motocyclisme*, and the Moto-Club de Nice, while a prize will also be given by the President of the French Republic. Two of these cups will be allocated as team prizes for clubs and manufacturers, and we understand that there are several English firms and teams nominated by clubs desirous of competing for these special prizes.

The route will be Paris-Dijon *via* Val Suzon (a non-stop section), Dijon-Lyon *via* Nantua (the same route as in 1914). After Nantua there will be a non-stop section, and competitors will have to traverse a snow-covered pass, but they will be preceded by a snow plough, which will clear the road. The next section will be Lyon-Marseilles, and the final stage will be from Marseilles to Nice, *via* Trets, Brignolle, Fréjus, and Cannes. Though Nice is the actual finishing point, the trial will continue through Nice to La Turbie, eighteen kilometres distant, the final section being a non-stop section finishing at Mont Agel. The last part of the trial will comprise a flexibility test.

M. Gaston Sweerts, who is over in England, informs us that he has received promises of support from a number of the best-known British firms, and Continental entries, he tells us, are also coming in satisfactorily.

OBSERVATIONS AT THE SHOW.

Monsieur Paul Kelecom, the F.N. engineer attached to the Liège factory, was an interested visitor to the Show, showing the same keen interest in the various designs displayed as he did in the Six Days Trial machines at Llandrindod Wells.

Much praise was bestowed on the latest designs of runabouts, two or three forming essentially practical jobs, to use an engineer's expression.

Will anybody *ever* forget the 1919 Six Days Trials? Ask S. L. Bailey!

The suspension of the Clyno Co. for advertising an unofficial Scottish Trial is not likely to last long.

Keen interest was displayed in the A.C.U. decision to organise a real lightweight T.T. for machines under 250 c.c. The go-ahead Cedos firm immediately announced their intention to enter six machines.

A visitor went to the A.J.S. stand to congratulate the makers on such a fine product as he possessed.

We were told that the new Raleigh will not be available for delivery until next June.

The Stanger V twin two-stroke was one of the real novelties in the Show. Its road performances will be watched with interest.

Talk of further A.C.U. observed trials was prevalent at Olympia.

Capt. P. Pike was entertained to dinner on Friday evening following his successful ride from North to South on an O.K two-stroke described in our last issue.

A general reunion of motor cyclists was observable at Olympia. We met many men recently discharged from the Services, including W. H. Bashall, A. G. Fenn, Cecil S. Burney, and J. Cocker.

June, after all, is the month for the T.T. next year, the 16th and 18th having been arranged for the two races. It is highly probable, if the 500 c.c. event is reinstated, that the Junior and Lightweight events will be run concurrently.

Such is the divergency in prices that some high-class sidecar outfits are actually cheaper than solo mounts. Instance the new P. and M. outfit at £127, than which no better finished machine exists. Several motor bicycle prices are much higher than this figure.

Observe that scooters are growing in size, wheels, etc., being increased until the weight approaches 100 lb. We are getting nearer to the miniature open frame motor bicycle every day.

One of the many Show reunions was the meeting with Southcomb May of many of the original members of the M.M.G.S. at the Clyno stand.

NOVELTIES IN ENGINE DESIGN.

A Big Twin with Overhead Camshaft and a Two-stroke Flat Twin with One Combustion for Both Cylinders.

Metric Engines.

AERO practice is slowly influencing the design of motor cycle power units, and one of the latest examples in which our accepted practice has been abandoned is seen in the Metric series, which will be offered in various sizes of single and two-cylinder models.

Many advanced features are incorporated in the design, such as detachable heads, overhead valves and camshaft, and mechanical lubrication.

The camshafts are secured in completely enclosed housings above the cylinder heads, and they are driven by skew gears. Complete details of these engines will be given in next week's issue of *The Motor Cycle*.

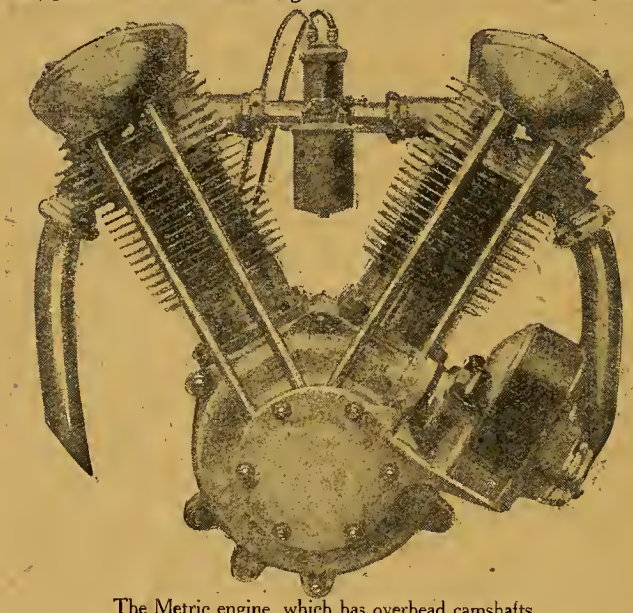
A two-stroke cycle attachment—the Young.

The Young Attachment.

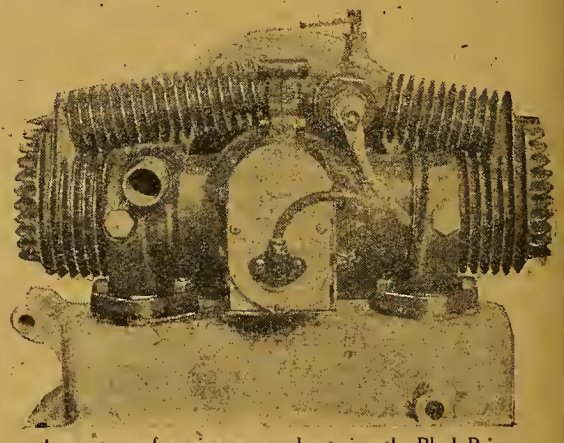
A pedal cycle motor set having a 1¾ h.p. two-stroke engine is the Young, which is handled by the Mohawk Cycle Co., Ltd., Hornsey, N. This power unit has a detachable cylinder head, into which the plug and release valve are screwed, while the transfer passage also is covered by a removable plate.

The Black Prince.

This engine is very unusual, in that, although it is a horizontal two-cylinder, two-stroke, only one sparking plug is used. A passage cast with the cylinder heads brings this plug into communication with both cylinders, so that the explosion occurs in each simultaneously. By this method the torque obtained is that of a single-cylinder two-stroke, *i.e.*, one impulse per revolution, but the balance, of course, is almost perfect. Amongst other novel features may be mentioned the casting of each half of the crank case in one piece with its corresponding cylinder.



The Metric engine, which has overhead camshafts.



A new type of engine, a one-plug twin—the Black Prince power unit.

PROVISIONAL PROGRAMME OF 1920 OPEN EVENTS.

IT is well known that a decision had been arrived at between the A.C.U. and the leading clubs not only to limit the number but also to distribute as widely as possible the open events.

The subjoined list of fixtures is provisional, and may be subject to some slight variation. At the same time, it shows that the sporting element of the motor cycling community has not been forgotten in any part of the country, and it is sincerely to be hoped that adequate support will be forthcoming for even the most outlying competition.

Sept 18th.—Liverpool M.C. Reliability Trial.
Sept. 25th.—Redditch and District M.C.C., Wolverhampton M.C.C. and Kidderminster M.C.C. Reliability Trial.

A SIMPLE ATTACHMENT.

We learn that Messrs. A. Pickard, 4, New Burlington Street, London, have been appointed general agents for Great Britain and the Colonies for the Cyclo-Motor attachment, which was exhibited at both the Paris and London Shows. This device can be fitted in five minutes to any make or type of pedal cycle, and the method of fixing is such that no alterations are required.

MODERN STEEL.

Dr. Leslie Aitchison, of Sheffield, read a paper on "Modern Automobile Steels," on Wednesday, November 26th, at the Baths Assembly Rooms, Wolverhampton, before the members of the Birmingham Metallurgical Society (who paid a visit to the works of the Sunbeam Co., the Wolverhampton engineers, and the Society of Chemical Industry to the number of 450. Mr. Lantsberry, chief chemist, B.S.A. Co. (Birmingham), presided. Dr. Aitchison pointed out that automobile steels must have comparatively high strengths. This meant that the automobile engineer was primarily interested in alloy steels, since the plain carbon steels could not be relied upon to give the same high strengths as were to be obtained from the alloys. Many of the alloy steels would give any maximum stress between 50 and 100 tons per square inch, but all did not do this with the same ease. The only structural steel of a reasonable price which would give 100 tons per square inch easily was nickel chromium steel.

—We must keep down Expenses—

"The Amateur Mechanic," compiled by skilled craftsmen in simple, non-technical language, and helpfully illustrated, is

The Guide to Show Us How to Do It.

"THE AMATEUR MECHANIC" includes practical teaching for the Motor Cyclist and Motorist on How to Clean overhaul, and do simple repairs to their Motors

It also teaches those money-saving arts which are invaluable to every citizen: Shoe-making; House Decoration Boat-building; Book-binding; Picture-framing; Sign and Ticket Writing; and Repairing of Furniture. Bicycles Typewriters, Windows, Spectacles, Mailcarts, etc., etc.

For the Motorist.

As an instance of the thoroughness with which every subject is treated, we append a list of the titled sub-sections, into which the section on "How to Overhaul a Motor Cycle" is divided: The Wheels —The Frame—The Tank and Fitments—The Carburetter—How the Engine Works—Overhauling the Engine—The Driving Gear—The Ignition Apparatus —The Reassembling. This section has four practical illustrations.

The section on "Overhauling a Motor Car" has titled sub-sections as follows: Introduction—The Preliminary Examination—Engine—Bearings—Carburetter—Couplings, etc.—Flywheel—Clutch Fork, etc. — Change Gear — Steering Gear, etc. — Road Wheel—Frame Springs, etc.—The Ear Test—Testing the Engine: Compression Testing—Testing with the Engine Running—Worn Bearings—Knocking—"Popping"—"Hunting"—Silencer at Fault—Clutch—Change Gear—Undue Heating of Circulation Water—Lubrication—Testing on the Road—Ignition—Valve Timing—Defective Compression—The Shafts—A COMPLETE OVERHAUL: Testing for alignment—Swivel Bearings, Wheel Bearings, etc.—Tyres—Removing Valve Chamber Covers—Grinding in Valves—Removing the Engine—Testing Truth of Pistons—Removing Flywheel—Timing Gear —Magneto—Gudgeons and Pins—Case-hardening—Removing Piston Rings—Engine Repairs—Testing Bore of Cylinders—Truing Journals—Truing Brasses —Bedding the Crankshaft—Big End Bearings—Renewing Clutch Leather—Ball Bearings Gear Renewal, etc.—Oiling Axle Springs—Aligning Gear Box and Engine—Reassembling Engine Accessories—Brakes. This section has 27 illustrations.

MR. LEONARD ROE, Quorn, Leicestershire, writes: "I am very much interested in your 'Amateur Mechanic.' I have mended my watch, which had not been going for twelve months, from its instructions. Now I am going to restore the colour of a pair of old brown boots. The articles on 'Miniature Electric Lighting' are very interesting; I have already fitted my cycle with electric light through these."

To make and to mend, to alter and adapt and improve things used in the house, the office, the works, the field, and the garden.

Invaluable to the motorist as a rider and as a citizen.

For the Citizen.

How to paint and paper a room—To sole and heel and patch boots and shoes—To mount maps—To bind magazines and to rebind old books—To make a pair of hand-sewn boots—To restore colour of old brown shoes—To make household furniture—To reseat chairs—To upholster sofas, etc.—To install a speaking tube—To make a wire bracket for placing over oil lamp or gas bracket, so that food can be heated over it—To clean a Primus or other stove—To repair bicycles—To overhaul a motor car—To repair motor cycles—To work in metal—To colour metals—To make a garden frame—To repair water taps—To varnish a violin—To remedy damp walls —To repair the piano—To make a padded chair from an old cask—To make mailcart and perambulator hoods—To mend penknives—To stuff animals —To dress furs—To stuff and mount birds—To do wood inlaying—To cure a smoky chimney—To prepare working drawings and how to read working drawings—To make a chemical weather-glass—To renovate a grandfather's clock—To make invisible ink—To make garden furniture, arbours, arches, seats, summerhouses, tables, etc.—To use metal-drilling tools—To clean bookcovers—To renovate mirrors—To upholster furniture in leather cloth—To mend broken china—To do fretwork—To build a boat—To make a canoe, etc.—To lime-white poultry-houses—To do gold-plating and silver-plating—To clean a watch—To mend keyless watches and ordinary watches—To distemper ceilings and walls—To make picture frames and frame pictures —All about curtain fittings—To make metal castings—To make tracing paper, waterproof paper, fireproof paper, etc.—To clean paint off glass—To fit up a motor workshop—To clean boilers—To fix an anthracite stove—To regild and restore picture frames—How to use spanners—To make doors and windows draught-proof—To paint walls—To make a garden path—How to do nickel-plating—To cure noises in hot-water pipes—To make soap at home—India and glue varnishes—To clean and repair locks —All about acids for etching metals—Micrometers, how to make and use them—How to make plaster casts etc., etc.

MR. T. G. RIORDAN, Upper Tooting, S.W., writes: "With absolutely no knowledge to guide me, after reading the articles in 'The Amateur Mechanic on Boot-making, I was able to make a pair of boots, partly hand-sewn and partly riveted: and not only make them, but make them well. Since then I have made a very fine pair of lady's shoes, which are also a success. I consider nothing I could say about the work would be too much. . . ."

OUR

FREE BOOKLET

will tell you all about it. It shows pages and pictures from "The Amateur Mechanic."

MR. A. J. TATTON, Keresley, near Coventry, writes: "'The Amateur Mechanic' is beyond praise. I feel convinced I can make or repair most of the articles dealt with depending only upon the beautiful illustrations."

NO CHARGE AND NO OBLIGATION TO ORDER.

To THE WAVERLEY BOOK CO., LTD. (M.C.7. Dept.),
96, Farringdon Street London E.C.4

Please send me, without charge or obligation to order, your Free Illustrated Booklet containing all particulars as to contents, etc., of "THE AMATEUR MECHANIC," also information as to your offer to send the Complete Work for a mere nominal first payment, the balance to be paid by a few small monthly payments, beginning thirty days after delivery.

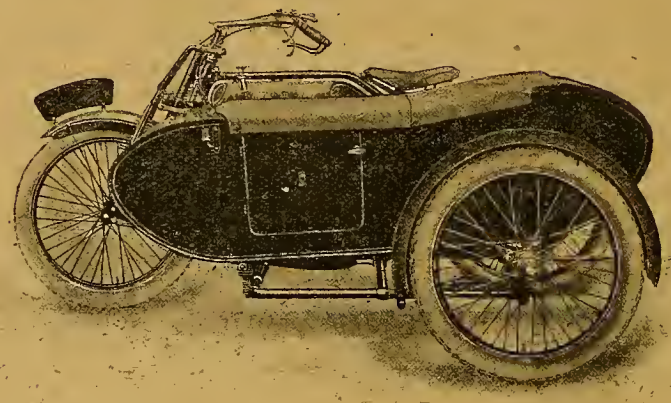
The Masterpiece of Motor Cycle Construction



ROYAL RUBY

Patent Spring Frame and Spring Wheel Sidecar Chassis, and the reasons for its great popularity.

Specially designed head. Eccentric adjustment for chains, giving a forward and backward movement. Patent silencer. Adjustable footboards Patent strengthening stays to front down tube and from seat tube to gear bracket. Interchangeable wheels with spare wheel of knock out spindle type, with Royal Ruby patented quick detachable wheel removing system. Rear internal brake. All chain drive. Hans Renold chains. Lucas Electric Lighting Set, Tank, special registered design. The Sidecar is fitted with Royal Ruby patent spring wheel and other improvements, specially designed body for comfort, fitted with hood and screen.

Facilities have been made for quickly removing pleasure car to be replaced by tradesman's carrier if desired; this only takes a few minutes, without interfering with any springs or shackles.

The Ruby Cycle Co., Ltd.,

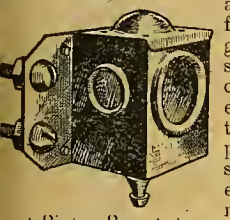
Manufacturers and Patentees of the Royal Ruby Cycles, Motor Cycles, and Sidecars,

CANNEL ST., ANCOATS, MANCHESTER.

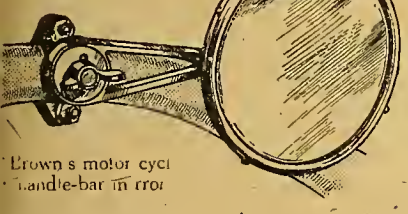
ACCESSORIES for 1920

Not the least interesting items among the Motor Cycle goods introduced for the coming year are the many new accessories which are now available. In the following pages we give a comprehensive review of these small but necessary adjuncts to the pleasures of the pastime which were exhibited at Olympia last week. In addition, there are included other useful fitments which were not exhibited by their makers, but were to be found on the stands of other firms or in the sample cases of city showrooms

MESSRS. BROWN BROTHERS, LTD., 20-34, Great Eastern Street, E.C.4.—This firm has now adopted its well-known Duco spring gaiters for cycle cars. These are most useful for retaining grease in the spring leaves, causing much easier riding to the vehicle and protecting the springs from the elements. A novelty shown on this stand was a pair of electrically-heated gloves, of the type used by our airmen during the war. They should be especially interesting to those motor cyclists who own electrically equipped motor cycles, as they are sold in types suitable for 6-volt outfits. They



A Brown Bros tail lamp.

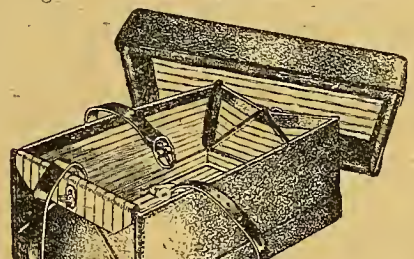


Brown's motor cycle handle-bar mirror

are intended to be worn inside ordinary gloves. Shown for the first time on this stand was the Highlow petrol gauge.

J. B. BROOKS, LTD., Great Charles Street, Birmingham.—The feature on this stand was, of course, Brooks saddles, of which there are several well-known types. All the latest models have a small coil spring under the nose. Besides this feature, the frame of the B.185 is suspended on cantilever leaf springs, the Brooks normal coil spring being used in addition. The B.225 is a saddle with entirely leaf suspension, and the new B.175 can now be supplied to fit directly to the frame instead of by the usual seat-pillar. A collapsible valise was also shown.

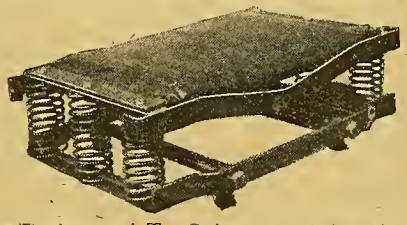
THE COUNTY CHEMICAL CO., LTD., Chemico Works, Bradford Street, Birmingham.—Under the name of Chemico many well-known proprietary articles were exhibited. Coolie motor oil, Chemico patches and repair outfits, enamel, etc., are well-known standard lines, and Apollo electric horns, sparking plugs, etc., were also exhibited and sold by this company.



A collapsible valise for the carrier—one of the Brooks range of leather goods for motor cyclists

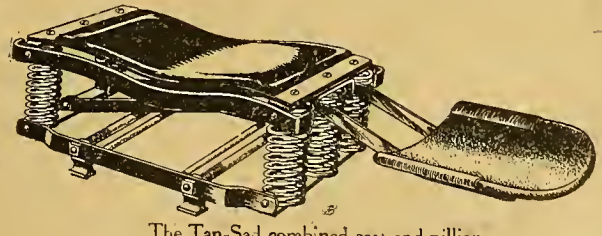
THE TAN-SAD WORKS, 9, Freeman Street, Birmingham.—The exhibit comprised various forms of the well-known Tan-Sad pillion seats, the new seat suspension recently described in *The Motor Cycle*, and the very neat acetylene rear light combined with the rear number plate, which was illustrated in the same issue (Nov. 20th, pp. 604 and 613).

THE LEATHERIES, LTD., Sampson Road North, Birmingham.—The saddles constructed by this firm are already popular. A new feature displayed was a special pan seat for scooters. It will be remembered that the firm manufacture the excellent detachable expanding valises (fitted with special carrier attachments) mentioned in *The Motor Cycle* in the issue for November 20th.



The improved Tan-Sad—now upholstered and having shorter springs.

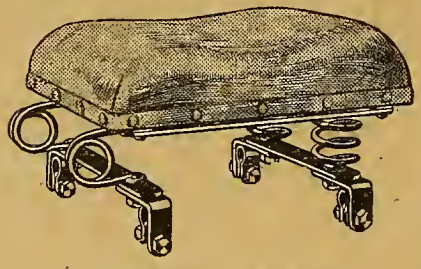
MESSRS. BLUEMEL BROTHERS, LTD., Wolston, near Coventry.—In addition to the usual range of tyre pumps, cycle car steering wheels, celluloid handle-bar grips, and sparking plugs, Messrs. Bluemel Brothers were showing a simple side-car screen of celluloid with side windows and apron, and fastened to the body by means of two clips, one each side. On these being loosened, the screen may be lifted clear, so as to give the passenger access to the sidecar body. This was illustrated in our issue for November 20th.



The Tan-Sad combined seat and pillion.

Accessories for 1920.—

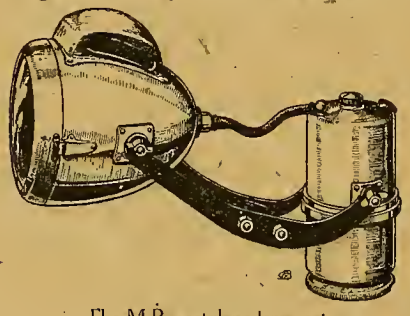
MESSRS. A. E. WILBY, LTD., 113, Holloway Head, Birmingham.—The Burton plug formed the chief exhibit on this stand, though motor cycle accessories of several types were included, such as tube and belt cases and a carrier seat. Burton



A pillion seat by A. E. Wilby

plugs are made with detachable bodies, the steatite being carefully shrunk to the correct limits. One, two, or three-point plugs can be supplied.

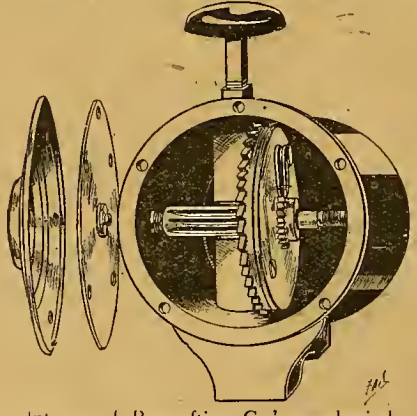
THE MECHANICAL PRODUCTS CO., Armoury Close, Bordesley Green, Birmingham.—A very handsome semi-stream-



The M.P. acetylene lamp set.

line acetylene head light, complete with generator and tail light, was exhibited.

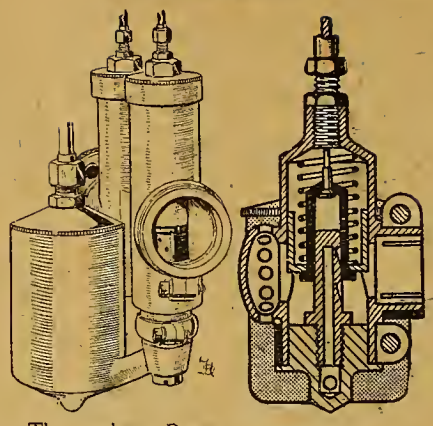
BANCROFTIAN CO., 64-78, Bishopsgate, E.C.4.—A large range of standard accessories, tyres, lamps, spares, and fittings is handled by this firm. Mechanical



Interior of Bancroftian Co.'s mechanical horn.

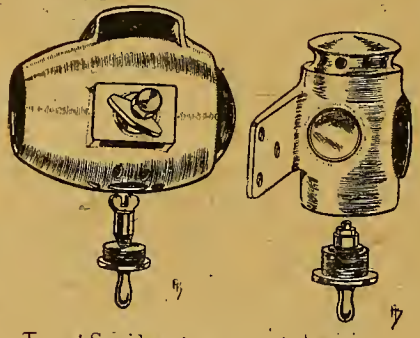
horns are a speciality, and they are one of the few houses with a really large stock of these necessary fitments.

MESSRS. ROTHERHAM AND SONS, LTD., Spon Street, Coventry.—Everest carburetters, also a model of the one-lever variety, specially suitable for scooters



The two-lever Everest carburetter and a section of the Auto-wheel model.

and Auto-wheels, the Bonniksen speedometer, which is being manufactured in large quantities, and an ingenious lubricator consisting of an ordinary lubricator provided with a ball resting on the seating. When the machine travels along the road the ball jumps off its seating and allows the oil to flow through gradually; when the machine is at rest it retains the oil, as the ball remains on its seating.



Two of Surridge's lamps in cast aluminium for sidecar and rear number plate.

R. SURRIDGE, 73, Church Street, Camberwell, London, S.E.5.—Samples of the well-known Holdtite patch, and new and attractive tail and sidecar lamps made of aluminium castings and with air holes scientifically designed, rubber tubing for acetylene lamps incorporating a gas bag, all kinds of head and tail lamps, and horn bulb patches for the purpose of repairing damaged horn bulbs.

MESSRS. C. H. PUGH, LTD., Whitworth Works, Tilton Road, Birmingham, were showing the latest pattern Senspray carburetter in part section, so that visitors to the Exhibition could see its working. As

may be remembered, the Senspray wo on the injector principle. The lat pattern is practically automatic in action, and can be quickly adjusted suit changes in temperature or clima Another feature on the stand was handle-bar control, in which the pull the wires was direct, as they do have to bend round a drum-shaped lev

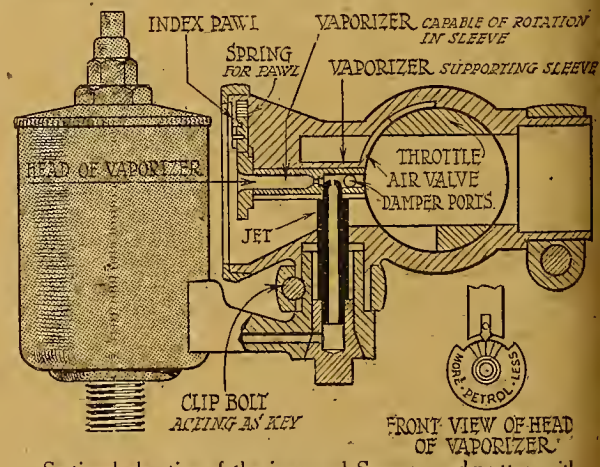
XL-ALL, LTD., Hall Green, Birmi ham.—The parallel motion saddles we of course, exhibited, also the XL-

The XL-All saddle with back rest.

plug and a small model known as t Baby. A sectional saddle showed t interesting features of the parallel moti very clearly. All the latest patterns we shown, including a saddle with a co fortable back rest.

PATCHQUICKS PATENTS, LTD., Tiverto —Patchquick repair outfits are too we known to our readers to need more th a passing reference, but we can speak their excellence after years of experien with them.

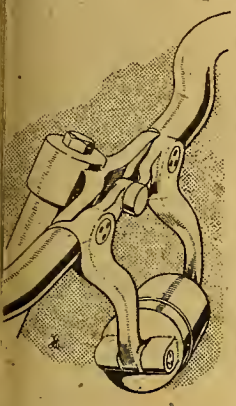
THE ELEPHANT CO., LTD., Neate Stre Camberwell, S.E.5.—Among the numero productions of this company we notic an excellent repair outfit containing, addition to the usual articles, a sm tyre gaiter, a small roll of copper wi a small roll of insulating tape, and sparking plug washer, useful items whi every motor cyclist should be glad have on his machine.



Sectional elevation of the improved Senspray carburetter, with new damper action, which decreases or increases the suction on the jet at low speed

essories for 1920.—

ictory Co., engineers, 146, Lincoln's n, Birmingham.—A very neat floating adle-bar is the invention of this firm. e bars are hinged close to the pillar, d have interconnected extensions so as ensure correct action. A lever exding downwards from each pivot is nected to an ingenious system of springs. Two springs are employed, a light spring coming into action first to absorb slight vibrations, and a more powerful spring to absorb the heavier road shocks. Both springs are enclosed in a telescopic tube, and by an arrangement of spring stops, any upward pull on the bars affects the strong spring, ins ensuring the necessary rigidity to ve a safe feeling. The Victory floating ndle-bar has already undergone road sts with very satisfactory results, and specially adapted for scooters.

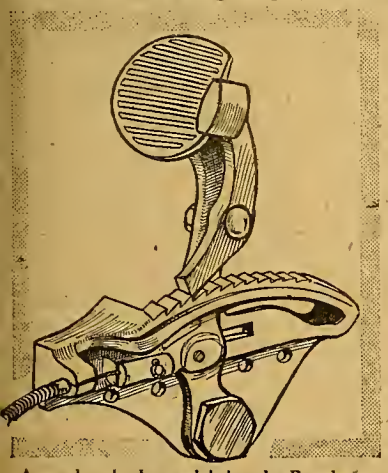


Victory spring handle-bar

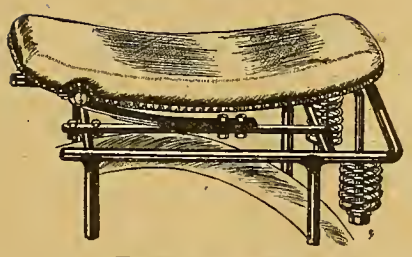
Middlemores (Coventry), Ltd., Little ark Street, Coventry, were showing vo motor cycle saddles of somewhat milar pattern, one of which had the il springs connected to the frame of the ddle by means of plain stright rods, hile in the case of the other single leaf rings were employed instead of the ds.

The Midland Gear Case Co., Ltd., ridge Street Works, Birmingham.—The hibit consisted of tool cases and toolgs, including many other leather ods.

Bowden Wire, Ltd., Victoria Road, illesden Junction, N.W.10. — Well-nown Bowden accessories, such as the owden extra air inlet, Bowden wires d cables of all descriptions, together ith special brake and clutch attachents, form a striking display. The



A ratchet brake pedal by the Bowden Wire Company.



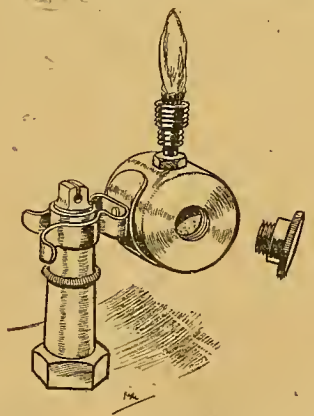
Terry's pillion seat.

standard articles manufactured by this firm are probably known to every motor cyclist.

Messrs. Herbert Terry and Sons, Ltd., Redditch.—This firm was showing the Terry patent spring links for motor cycles for improving the motion of spring forks, spanners, valve spring compressors, pump clips, screwdrivers, belt fasteners, a tyre clamp for holding a section of the tyre in position when mounting it, and springs for every purpose connected with motor cycling.

Terry's check spring for sidecars.

Messrs. Alfred Dunhill, Ltd., 359-361, Euston Road, N.W.1.—Messrs. Dunhill had an extensive exhibit of accessories and clothing. Among the former we noticed an ingenious emergency light, consisting of a small brass container and wick, held in a spring clip and designed to fasten round the burner of an acetylene lamp in the case of the generator failing. This little con-



Emergency petrol light for head lamps marketed by Dunhill, Ltd.

tainer is filled with a few drops of petrol, and will burn with a small light for a considerable time, thus enabling the motor cyclist to reach home. Other specialities of this firm are a lighting set run off the accumulator, consisting of a handsome head light, side light and tail light, finished in black and with plated rims. We were also shown a magneto combination knife, which included a blade, a plug tester for shorting the plug between the terminal and plug body, and a clearance gauge for the contact breaker points.

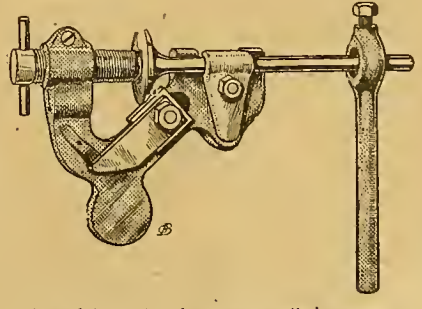
The Coventry Plating and Presswork Co., Ltd., Raglan Works, Lower

V section front mudguard exhibited by the Coventry Plating and Presswork Co.

Ford Street, Coventry.—Various examples of presswork, such as small spanners, change speed gates, also an excellent V section mudguard, wide at the base and slightly turned up at the front, so designed that it prevents mud from being splashed all over the riders, were shown.

Messrs. Joseph Lucas, Ltd., Great King Street, Birmingham.—A fine range of very beautifully finished acetylene head lamps, horns, and adjustable spanners. The firm has long been famous for its magnificent workmanship. Its electrical exhibits are dealt with elsewhere in this issue.

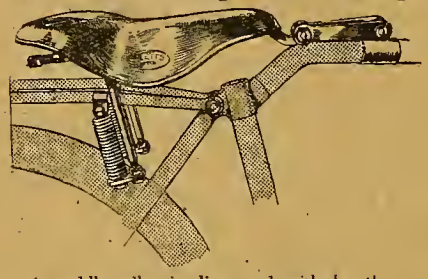
Lake and Elliot, Ltd., Braintree, Essex.—As large manufacturers of tools for the cycle and motor cycle repair trade, some excellent labour-saving devices have been designed by this firm. Two of these will appeal to the rider who effects his own repairs. The first is the Millennium valve truer, which will effectively reface any size of motor cycle valve; it may be held in the vice or in the hand as convenient, and its use will eliminate much of the labour of valve grinding. The other useful little tool we must mention is the magneto sprocket and gear wheel drawer, which has specially toughened jaws of compact form, so that they may pass behind a sprocket in a case where there is little clearance.



A useful tool for the motor cyclist's garage kit—the valve truer made by Lake and Elliot.

Accessories for 1920.—

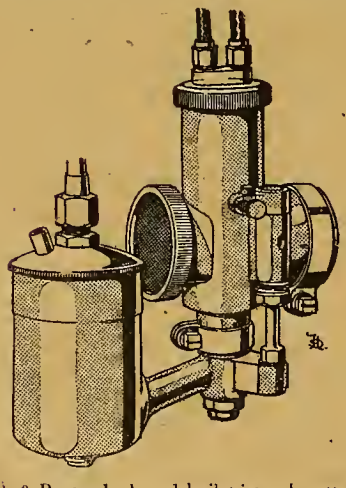
LYCETT SADDLE AND MOTOR ACCESSORIES CO., LTD., Bromley Street, Birmingham.—A large range of toolbags, tool rolls, and a collapsible swag bag for attaching to a motor bicycle carrier which will contain all the motor cyclist needs in the clothing line for touring.



A saddle-pillar is dispensed with by the Lycett patent motor cycle seat.

The firm is showing a saddle hinged to the top tube, and with a crossbar at the rear clipped on to the carrier. This does away with the need for a saddle post. Another form of saddle has the coil spring attached to a hinge so that it follows the movement of the rod attached to the saddle frame, which is fastened to the lower portion of the spring, thus ensuring a direct pull on the spring under all conditions.

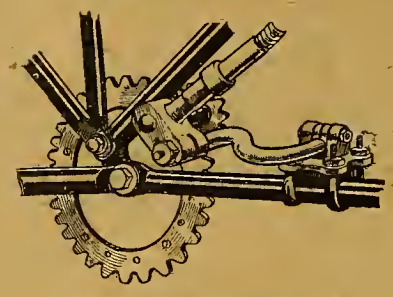
MESSRS. BROWN AND BARLOW, LTD., Westwood Road, Witton, Birmingham.—Examples of the well-known Brown and Barlow carburetters, including the two-stroke variety, specially designed to give even firing at slow speeds without four-stroking. It consists of a small jet and choke, and above the jet a vaporising cup. The back cap over the main air



B. & B. standard model pilot jet carburetter.

intake is supplied in various sizes, with different numbers of holes in each for the admission of air, and by this means the carburetter may be made to suit the particular engine to which it is fitted. The other model shown is the well-known tapered needle pattern, provided with a pilot jet.

MESSRS. S. NORTH AND SONS, LTD., 14, Soho Square, W.1.—An excellent display of the well-known and accurate Watford speedometers, which are now provided with black dials on which there

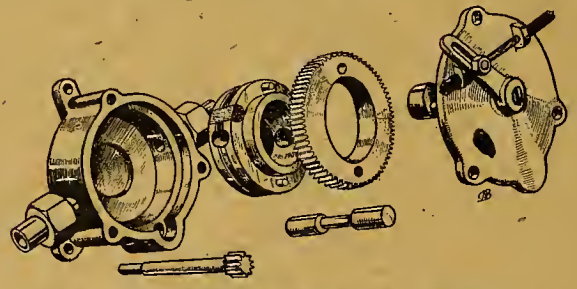


Rear wheel drive is adopted on the Watford speedometer.

are white figures. Numerous examples of magnetos were shown, but unfortunately there was not a single motor cycle pattern among them, which was a pity, as Watford magnetos are famous for their accurate workmanship and high finish.

MESSRS. BRAMPTON BROTHERS, LTD., Oliver Street Works, Birmingham.—The well-known Brampton spring forks, motor cycle lugs and their spring chain, every third pitch of which is connected by a spring. This chain gives a flexible drive, and does away with the necessity of a transmission shock absorber.

MESSRS. S. A. LAMPLUGH, LTD., King's Road, Tyseley, Birmingham.—A plunger oil pump with only three moving parts

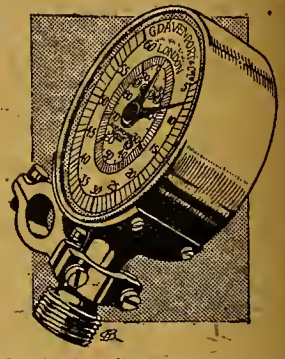


Throttle control is fitted to the Lamplugh mechanical pump which is here shown dismantled.

and without valves. The pump throw is altered by varying the eccentric, and this is interconnected with the throttle so as to give more oil as the load increases. It may be driven off the magneto shaft and is practically a flush fitting in the magneto transmission casing.

THE MICROMETER ENGINEERING CO., LTD., Spon Street, Coventry.—Jelley motor cycle saddles having specially constructed tops were exhibited. These tops are constructed somewhat on the lines of a tyre cover, in that they are made of special composition partly composed rubber and have a canvas lining, whi provides just sufficient stretch to rend the saddle thoroughly flexible. T back plate for the springs is moulded i and the saddle is waterproof and ve flexible.

MESSRS. G. DAVENPORT AND CO., LT 101, 103, and 105, Clerkenwell Roa



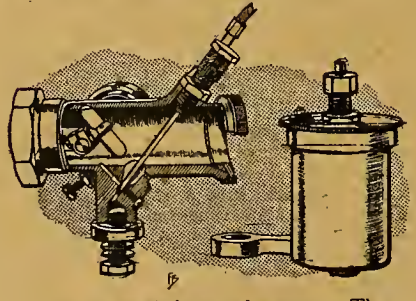
Speed and trip mileages are both indicated by hands and the dial of the Davenport speedometer.

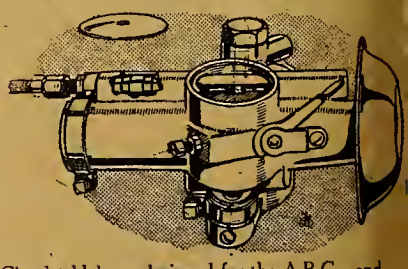
E.C.1, were showing goggles, handle-ba mirrors, motor cycle handle-bar watche and a speedometer working on the cer trifugal principle.

PRICES' COMPANY LTD., Belmont Works Battersea, S.W.11.—Samples of oil for al types of motor cycles Manulav motor soap fo cleaning the hands hub lubricant, and new grade of hub lubricant which retains it properties for a considerable length o time, and which wil be found invaluable fo inserting between the spring leaves of the sidecar.

THE COVENTRY CHAIN CO., LTD., Coventry.—Famous for having made the chains fitted to Tanks, this firm was showing various types of motor cycle chains, including both the roller and silent varieties.

THE EAST LONDON RUBBER CO., LTD., 29, Great Eastern Street, E.C.2.—This was one of the largest exhibits in the Gallery, and staged almost everything the motor cyclist can desire, from the smallest detail to the complete Dalm two-stroke engine. Easting screens, toolbags, tools, clothing, etc., were shown.





Two new single lever carburetters. The new Claudel-Hobson designed for the A.B.C., and the Capac which is already a standard fitting on some makes.

SPECIAL PRIVILEGE.
A free weekly copy of

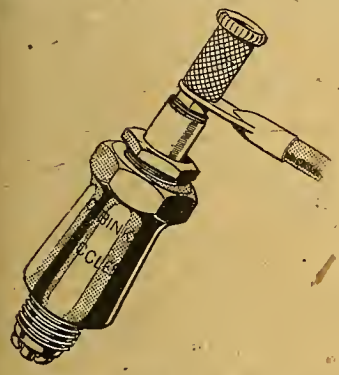
:cessories for 1920.—

Messrs. C. Binks, Ltd., Phœnix Works, Church St., Eccles, Manchester. Naturally, the chief exhibit on this and was the Binks three-jet damping rburetter. This has been described, id has many staunch adherents. Binks



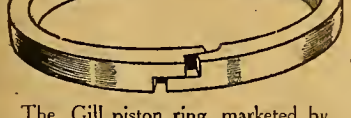
A novel plug—the Binks.

arburetters in all forms were exhibited, ncluding the racing model and three ypes of Binks plugs. In addition, ilencers and other Binks productions vere staged.

Messrs. Markt and Co., Ltd., 93-100, Clerkenwell Road, E.C.1.—We are often sked for mileage recorders which are eparate from speedometers, and motor yclists will find the gear-driven Veeder cyclometer shown at Olympia will fill their wants in this direction. This firm also exhibited the Johns-Mannville speedometer, which works on the centrifugal principle, is graduated up to 60 m.p.h., and has white figures on a black ground. The well-known long horn was also shown on this stand.

Markt's "Long" horn

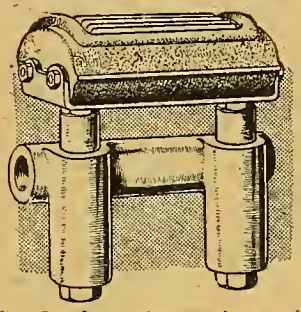
The Stanley Motor Belt and Fastener Co., 32, London Road, Bromley, Kent.—This firm not only makes and supplies a useful belt n sizes ranging from ⅜in. 1¼in., but deals n numerous accessories for belts. The Stanley belt fastener is well constructed, nd can be supplied with three different ize hooks, which adequately make up for ny adjustment to the belt caused by the ecessity for shortening through stretch, r owing to the use of an adjustable ulley. A further adjustment may be ccomplished by the use of the Stanley pare link, while yet another device is the Stanley belt fastener shield, which pre-



The Gill piston ring, marketed by Stanley Watson.

vents wear of the pulleys. It is specially designed for use with Philipson and other expanding pulleys. Quite a useful item is the box of Stanley spares, which contains a belt fastener, a spare link, and a belt shield, as well as various sizes of hooks. The company have also introduced a plain but well-made belt drill, designed so as to cut a clean hole of the correct size.

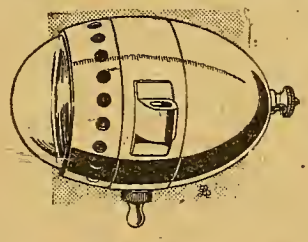
Rose and Co., 365, Foleshill Road, Coventry.—Spring footrests and footboards for standard machines have been introduced by this Midland firm which



The Roseden spring attachment for standard motor cycle footrests.

are of first-class quality and neat in appearance. The footrests are 16s. 6d. per pair, and the footboards £2 2s. A model of the former is also made in polished aluminium.

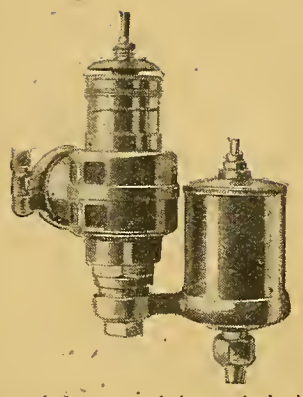
Westwood Rim and Patents, Ltd., Bordesley, Birmingham.—One of the chief advantages of Westwood lamps is that the burner is easily removable by unscrewing the base while the burner union



Torpedo-shaped lamps, such as this Westwood acetylene model, are neat and easily cleaned.

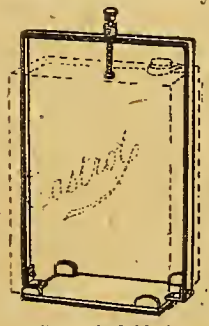
is threaded at the bottom so as to take a pump connection. This is an exceedingly useful feature, as it enables the tyre pump to be screwed on to the base of the burner and a blast of air blown through it, effectually clearing any obstruction. The lamp, which is designed to be bolted on to the number plate, has the white glass of the semi-opaque variety, which effectively distributes the light on to the numbers.

The Aston Motor Accessories Co., Ltd., Aston Cross, Birmingham.—The automobile carburetter, so highly spoken of at the present time, is shown in section; also the two-lever type. A novelty on this stand was a new control lever, which can be made to open either from right to left or left to right, and by removing a washer it can be instantly converted from a single to a double lever. The Aston Motor Accessories Company proudly boast that there is no rise in the



One of the types of Amac single lever carburetters.

prices of their goods while they are of twice the value they were previously.



The Wakefield oil tin carrier for the step of the sidecar.

Messrs. C. A. Wakefield and Co., Ltd., Wakefield House, 30-32, Cheapside, E.C.2.—Grades of oil suitable for all motor cycles, and an ingenious oilcan carrier by which the oil can be clamped to the running board of a cycle car or even clamped on to the carrier of a motor bicycle or sidecar.

The Challenge Oil Co., Ltd., Howard Works, Howard Road, N.16.—A large range of suitable oils, greases, and carbide.

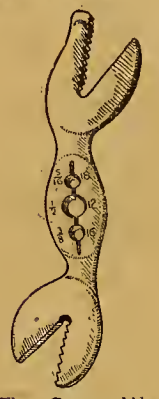
James Grose, Ltd., 4, Old Jewry, E.C.2.—The aim of every motor cyclist

Grose set of spanners; the largest has a three-inch measure stamped on. The sizes are indicated "over-flats."

should be to have a set of spanners which will fit every nut on his motor cycle. Spanners made to take a particular nut are the best to use, as they do not damage the nuts, and save both time and trouble in making adjustments. Messrs. James Grose have lately placed on the market a set of six spanners designed to take the smaller nuts on a motor cycle, which are all held together by one central screw, thus allowing these six spanners to take up very little more room in the toolbag than a single one.

Accessories for 1920.—

THE METEOR MANUFACTURING CO., LTD., 98, Tollington Park, N.4.—An interesting accessory which was exhibited

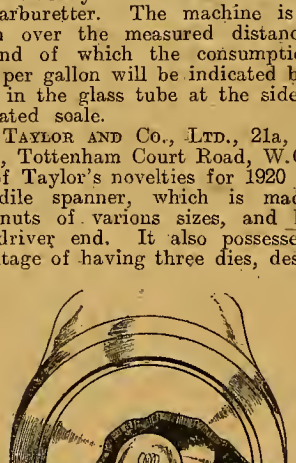


The Crocodile spanner, including a screw-plate.

The M.P.G. petrol consumption indicator.

by this firm, is the M.P.G. consumption indicator, of which there are two models, one for cycle cars and the other for motor cycles. When it is required to test the petrol consumption of a vehicle the machine is driven to the commencement of a measured mile, and the indicator is filled with petrol to the starting level indicated by an arrow. The flexible pipe located below this device is connected directly to the float chamber of the carburetter. The machine is then driven over the measured distance, at the end of which the consumption in miles per gallon will be indicated by the spirit in the glass tube at the side of a graduated scale.

H. TAYLOR AND CO., LTD., 21a, Store Street, Tottenham Court Road, W.C.1.—One of Taylor's novelties for 1920 is the Crocodile spanner, which is made to take nuts of various sizes, and has a screwdriver end. It also possesses the advantage of having three dies, designed

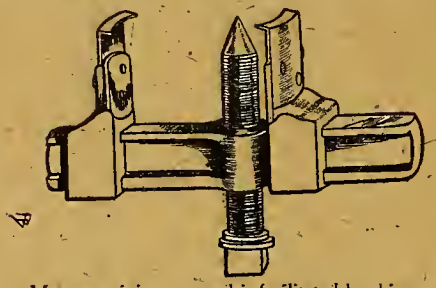


Taylor's adapter for the conversion of acetylene lamps to electric.

to take bolts of the following sizes, $\frac{5}{16}$in., $\frac{1}{2}$in., and $\frac{3}{8}$in., which should prove exceedingly useful in the case of a bolt with a burred end. Another useful accessory is an adapter made to screw into the place of the acetylene burner, so as to convert the lamp into an electric one. It is well made, easily fitted, and provided with a bayonet joint for the lamp and a bayonet joint at the base of the electrical connection.

MESSRS. POWELL AND HANMER, LTD., Cheston Street, Birmingham, were showing a large range of acetylene lamps. The chief novelty, their electric lighting set, is dealt with in another portion of this issue.

MESSRS. ERNEST H. HILL, LTD., Beta Works, Broomhall Street, Sheffield.—Some excellent examples of foot pumps and British-made horns, for which there is now an immense demand.



Magneto pinion removal is facilitated by this neat Lake and Elliot tool.

DOVER, LTD., Northampton.—Dover specialities consist of steering wheels, handle-bars, etc., covered with Doverite, which gives a beautiful black finish. Dover's signals were also exhibited in addition to motor cycle inflators.

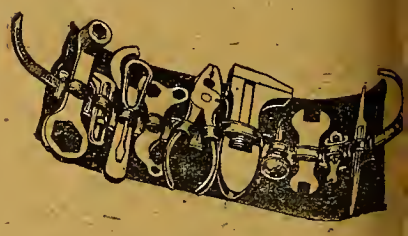
MESSRS. BEST AND LLOYD, LTD., Cambray Works, Birmingham, were showing their clever mechanical lubricator working in conjuction with their sight feed and hand pump, allowing the hand pump to be used when it is desired to give the engine an extra charge of oil. The mechanical oil pump is best fitted to the timing gear, but in many existing models it is fitted to the front end of the magneto chain case against the aluminium casing, with which it is flush-fitted. It is then driven off the end of the magneto spindle by means of a coupling. The throw of the pump may be altered so as to give more or less oil.

MESSRS. GOUGH AND CO., LTD., 180, Park Road, Hockley, Birmingham.—An excellent motor cycle saddle, the rear of which is suspended on the usual coil springs. The peak is also sprung, being provided with a leaf spring.

THE COOPER-STEWART ENGINEERING CO., LTD., 11, Broad Street, Bloomsbury, W.C.2.—Stewart speedometers have long been known to the public, and on this stand were to be seen examples of this popular and accurate instrument. The Stewart speedometer works on the magnetic principle, and is beautifully finished.

Magnetic action is employed in the Stewart speedometer.

ABINGDON ECCO, LTD., Tyseley, Birmingham.—In addition to the well-known Abingdon engines a very complete range of King Dick tools of all kinds were ex

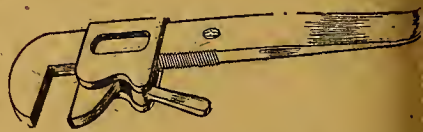


Practical equipment is a feature of the Abingdon King Dick tool roll.

hibited by this firm, which has a world wide reputation for the quality of it adjustable spanners.

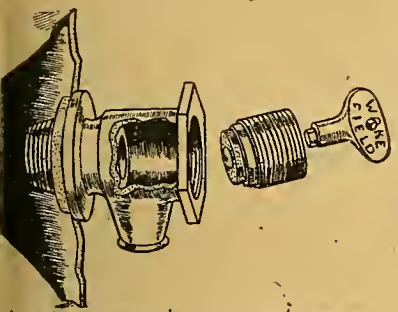
STURMEY-ARCHER GEARS, LTD., Faraday Road, Lenton, Nottingham.—Two interesting models in part section of the Sturmey-Archer two-speed and three speed gears respectively were exhibited These gears work on the dog clutch principle, and the two-speed form was shown for the first time. It is sold with o without a kick-starter. For 1919-20 a new control has been designed, which is carried on the down tube just underneath the tank, so is protected from wet, mud etc. It consists of a circular disc on the face of which are cut V shaped notches which correspond to the gear positions Another circular disc having V shaped projections machined on its face is held in position in the notches mentioned above by means of spring pressure. This disc is securely fastened to the long gear lever, which takes up a horizontal position in bottom gear, along the tank, and is thus more conveniently placed than the old gear lever carried on the box it self. The lever can be set in three different positions to suit individual taste

MESSRS. LEO RIPAULT AND CO., 1 King's Road, St. Pancras, N.W.1.—Oleo plugs for almost every type of engine were shown. One particularly fine example was included. This had a mica insulation, and was covered with a porce



Thumb operated spanner (Leo Ripault).

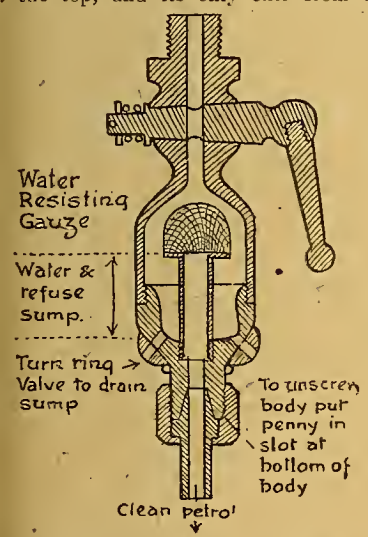
lain dome. The plug is particularly suited for high efficiency engines, and is instantly detachable by the use of the fingers only. Compression plugs and a very neat push-on high tension termina were included, and an adjustable spanner which can be instantly set to the size of nut required was shown. Another useful accessory consisted of a spark tester for shorting plugs while the engine is running. A vacuum tube is included and if the spark at the plug is satisfactory a bright blue flame is visible if, however, the plug is sooted up a small white spark only is seen.



A useful accessory for motor cycle garage men—a self-locking oil tap, placed on the market by C C. Wakefield & Co., Ltd.

The Bowden Brake Co., Ltd., Harrow oad, Willesden Junction, N.W.10.—landle-bars, fitted with Bowden levers, ontrolling the spark and throttle, the rake and exhaust lifter wires being arried inside the bar and passing rough a special lug just above the stem.

Flitten Bros., East Road, Cambridge. -The Wallis is an excellent petrol filter uitable for motor cycles. Petrol enters the top, and its only exit from the

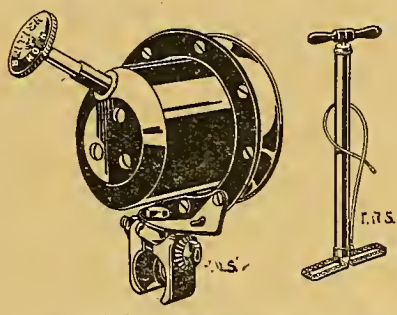


Water Resisting Gauze
Water & refuse sump.
Turn ring → Valve to drain sump
To unscrew body put penny in slot at bottom of body
Clean petrol

This section of the Wallis petrol tap and filter reveals its ingenious construction.

hamber of the filter is through the ome-shaped gauze at the top of the mall tube, consequently before the petrol an flow through, the chamber or sump as to be full of the liquid, and the water nd refuse is collected t the bottom. The kelihood of the gauze e i n g choked is ex- remely small owing to s position, and it would ppear that the filter eed not be taken down e r y frequently for leaning purposes, as at he base of the sump is knurled ring ground n to the base thereof n which are two holes egistering with two oles in the sump, so hat if the ring be u r n e d opposite the rrow on the filter body both holes will allow water or solid particles to escape.

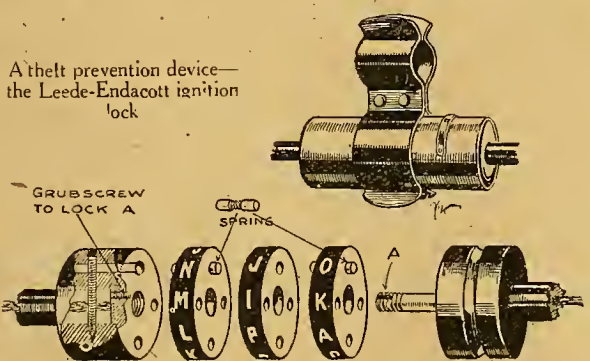
The Mohawk Cycle Co., Ltd., Alexander Road, Hornsey, N.—In addition to the Young engine, the two-stroke cycle attachment which has already been dealt with, the firm exhibited lamps, horns,



Two F.R.S. specialities—the British mechanical horn and a tyre pump with folding foot.

accumulators, handle-bar mirrors, etc. There was a fine display of F.R.S. lamps, both electrical and acetylene.

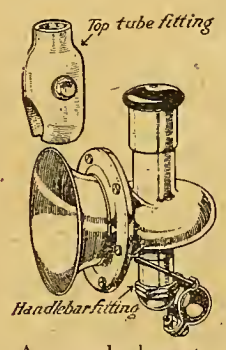
Distribution, Ltd., 7, Grape Street, Shaftesbury Avenue, W.C.1.—Any device which will effectually baffle the motor cycle thief is well worthy of mention in these pages. An ingenious attempt to render a motor cycle incapable of being started is the Leede-Endacott ignition lock. This consists of a small letter lock carried in a compact case and clipped to any convenient part of the frame. When it is required to break or make the circuit, it is only necessary to undo a small clip and slide the switch forward, when it is exposed to view. It consists of an ignition switch interposed at any convenient point in the high-tension cable, and may be had suitable for single, twin, or four-cylinder motor bicycles. It comprises four separate portions, the ends of which are connected to the ends of the high tension cable by means of long screws which penetrate the cable core, and three internal discs on which the letters are printed. Two of these discs allow the contact points to be placed in four different positions, so that at any time the combination of letters required to switch on may be changed. One of the ends is provided with a long brass spindle, on which the discs are free to rotate, and this is held in position by the small grub screw shown in the drawing. The spring contacts which engage with the brass contacts are shown separately.



A theft prevention device—the Leede-Endacott ignition lock

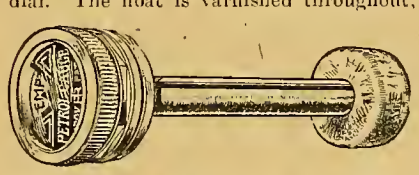
Leo Swain and Co., 237-9, Deansgate, Manchester.—Amongst a general collection of first-rate tyre sundries, the Leosco Non-Nip tube calls for attention. By virtue of a patent method of construction this tube (illustrated on another page) assumes the shape of the outer part of the cover when deflated either accidentally or otherwise. The arrangement prevents the damage which occurs to normal type inner tubes, which drop into the rim when punctured and deflated, and are there easily trapped in the tyre bead.

The Cowey Engineering Co., Ltd., Archer Works, Kew Gardens, Surrey.—In addition to the horn described in the issue of November 20th, the Cowey Engineering Company were showing their new speedometer, which works on an entirely new principle; in fact, two principles are involved in its construction, the centrifugal and the impulse system, which latter system has been the company's speciality for many years. There are two crescent-shaped segments connected by light flat springs, and in the centre of each of these there are two other segments forming a perfect crescent. These are connected to the drive, and as the driven pinion rotates, it transmits the power through a flexible shaft consisting of numerous short links to the segments, which, as the speed increases, tend to fly outwards, carrying, of course, the smaller crescent-shaped segments with them, which, as they fly round, hit a short shaft connected to the impulse movement, which drives the indicator needle. The whole system is extremely interesting, and we hope to deal with it at greater length in a future issue.



An exceedingly neat mechanical horn, the Cowey.

The Coventry Movement Co., Ltd., Spon Street, Coventry.—A neat little petrol gauge, consisting of a float and a dial. The float is varnished throughout,



Petrol and oil level indicator by the Coventry Movement Co.

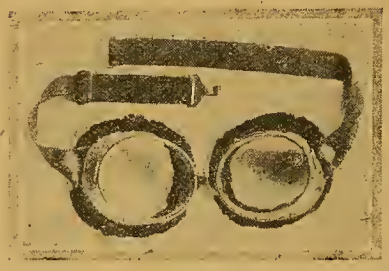
and is unaffected by benzole. The hand on the dial is connected to a tube in which there is a spiral groove cut, which rotates inside the main tube of the gauge.

Messrs. S. Smith and Sons, Ltd., 179-185, Great Portland Street, W.1.—In addition to their electrical accessories, described elsewhere in this issue, we noticed an extensive display of handle-bar watches, productions for which this firm has long been famous, motor cycle

Accessories for 1920.—

head and other lamps, horns, and the well-known Smith speedometer, which works on the centrifugal principle.

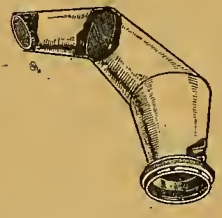
TRIPLEX SAFETY GLASS CO., LTD., 1, Albemarle Street, W.1, have intro-



A sample of goggles fitted with Triplex safety glass.

duced a pair of goggles fitted with Triplex glass, which should specially appeal to motor cyclists of either sex, as in the event of a fall there is no danger of the eye being damaged by flying glass splinters. Triplex safety glass has amply proved its worth on war service.

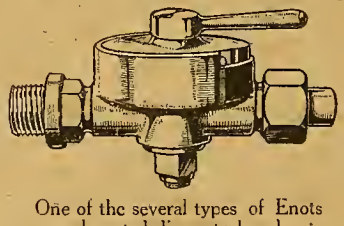
WALLIS, SUTTON AND WILSON, Irving Street, Birmingham.—A handy petrol filter, which can be easily carried by every tourist, should have a ready sale.



A petrol pourer with two filtering gauzes. It screws directly on to the stopper of the tin, and is known as the "Ideal."

Such an article is the "Ideal," illustrated herewith. Being provided with a union nut, it can be screwed on a petrol tin in any position, and contains two gauzes impervious to water. Thus, it enables the tank to be filled quickly and without waste. Made in brass, this useful little article is sold at 5s.; a cheaper model, in tin, costs 3s. 6d.

MESSRS. BENTON AND STONE, LTD., Bracebridge Street, Birmingham.—In addition to their cork-faced petrol tap, this firm was showing an excellent collapsible funnel and a burglar-proof petrol tap. The latter possesses several push buttons round its exterior. Opposite to

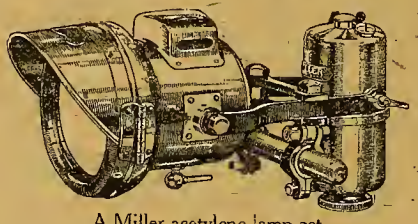


One of the several types of Enots cork seated disc petrol cock.

each of these is a letter, and unless the correct buttons are depressed, or if more than the two correct buttons are depressed, the tap when once shut cannot be opened. We also noticed an ingenious valve spring compressor working on the lazy-tongs principle.

MESSRS. HANS RENOLD, LTD., Burnage Works, Didsbury, Manchester, were showing various types of motor cycle chains, of both the silent and the roller variety. The popularity of the Hans Renold chain is well deserved, and they were showing on their stand a photograph of practically every make of motor bicycle which is equipped with their production. The latest chains are being fitted with an even further improvement in stud material.

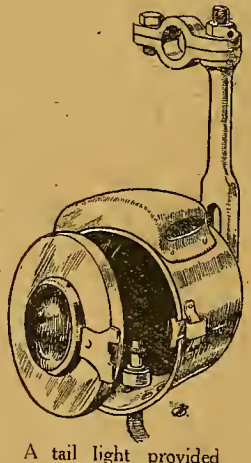
MESSRS. MILLER AND CO., LTD., Miller Street, Birmingham.—A large range of



A Miller acetylene lamp set

acetylene lamps. We were particularly impressed by the handsome little lightweight set, plated, complete, and fitted with a black finished bracket designed to clip on to the handle-bars. Electric equipment is described elsewhere.

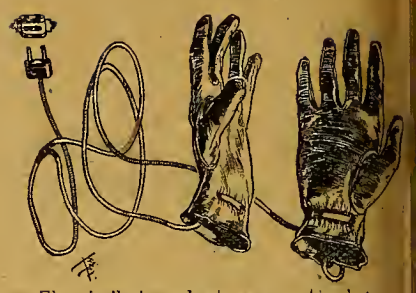
MESSRS. HOWARD S. COOKE AND CO., 116, Northwood Street, Birmingham.—Some excellent Steatite plugs were displayed, and, in addition, a new plug with mica insulation and detachable centre was shown for the first time. In this plug there are no loose parts except the washer. Cooling fins are turned on the body. Another H.S.C. feature was the quickly detachable weatherproof terminal, in which device the high tension wire can be attached to the terminal with extreme ease. On the same stand the R.P. variable pulley was shown. This is a variable pulley gear, in which the tension of the belt is kept constant by an eccentric motion of the internal geared pulley; fifteen ratios are provided for by notches on the quadrant.



A tail light provided with a reflector—the Miller.

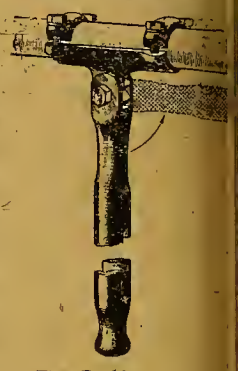
THE COOPER-STEWART ENGINEERING CO., LTD., 11, Broad Street, Bloomsbury, W.C.2.—The Stewart speedometer has long been known to the public, and on this stand was to be seen examples of this popular and accurate instrument. The Stewart speedometer works on the magnetic principle.

R. V. SIDECAR CO., 92, Humber Avenue, Coventry.—A neat sidecar stand



Electrically-heated gloves, marketed by Brown Bros.

which may be readily fitted to any standard chassis of tubular construction is manufactured by this company. It is attached to one of the main chassis tubes by a four-bolt clip, and contains a spring-loaded plunger, whereby it is retained either in or out of action. This device should be very useful, also, in the case of a sidecar which is often detached from the motor cycle, as by fitting it on the chassis near the chain stay attachment, it would form a support, and so be of considerable assistance in handling the sidecar when it is separated from the machine.



The R. V. sidecar stand.

The Leosco non-nip tube, showing the position it assumes when deflated.

TRADE EXHIBITS AT OLYMPIA.

At Olympia last week there were a large number of exhibits which, while not of great interest to the motor cyclist, were of goods which play an important part in the construction and equipment of their machines. We refer to what are known as the "trade" exhibits, included for the benefit of the manufacturers of motor cycles. Perry and Co. were showing chains, as were the Alfred Appleby Chain Co. A. R. Atkey, of Nottingham, showed tool equipment; the British Hub Co., hubs for motor cycles and cycle cars; W. Canning and Co., plating and polishing equipment; the Hoffmann Manufacturing Co., ball and roller bearings; Accles and Pollock, box spanners and tubes; J. A. Ryley, spring clips; the Stonehouse Works, brake equipment; and Alfred Smith, oil cans, pump clips, etc. In addition, there were several large wholesale houses, like Hobday Bros. and the Manufacturers' Accessories Co., showing lamps, horns, carburetters, and general accessories.

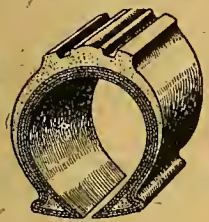
TYRES AT THE SHOW.

A Description of the Motor Cycle Tyre, Belts, and Allied Accessories.

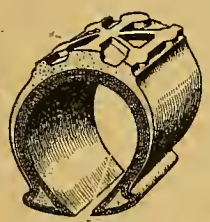
AVON.

wide range of Avon covers was n in all motor cycle sizes. Three- nd combination treads, together with led and the well-known Stonehenge re tread with transverse grooves are made in various sizes and weights. rests, rubbers, brake blocks, inner

von Stonehenge.



Bates.



Clincher Dreadnought.

s, and generator tubing are also ngst the products of the Avon ber Co.

BATES.

his Leicester firm has decided that variation from its previous range ecessary. A speciality is made of oughly sound and heavy covers for -powered machines. Two patterns tread are principally favoured, one g of the well-known form having a inuous rounded centre portion with ridges slightly undercut function as sideslip pre- ers while the other has outer ribs with a central of long rectangular studs. s tyres have been success- used in South Africa, the rity of finishers in the great nnesburg - Durban Race ng successfully completed arduous event on them.

CAPON-HEATON.

xcellent quality is a characteristic of Capon-Heaton inner tubes, which e shown amongst a varied assortment tyres and general rubber manu- ures.

CLINCHER.

o change has been made in Clincher adnought, A-Won, and De Luxe tyres latter being supplied with heavy extra heavy casings), nor in the ncher Flexis belts. The Dreadnought De Luxe tyres earned a very en- le reputation for the manner in ch they performed on W.D. motor es. Scooter tyres are being manu- ured by the North British Rubber Ltd., and we noticed an ex- lingly robust model of this type in standard 16×2⅜in. size.

CLIPPER.

lipper motor cycle covers and tubes made in all standard sizes and pat- ns.

DUNLOP.

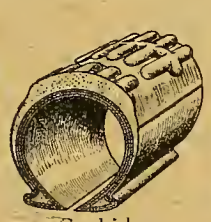
s one of the pioneer firms in the umatic tyre industry, the products of Dunlop Rubber Co. are always of interest, even though no change in de- sign or construction have been found necessary. The various tyres manufac- tured are the result of long experience, and the well-known tread with its double row of large staggered studs has proved its worth in innumerable competitions. There are also light sidecar, heavy com- bination steel and rubber-studded and three-ribbed treads.

Scooter wheels too are made by the Dun- lop Co., and a neat sample of the disc type with a detach- able rim was noticed. Many other samples of Dunlop specialities were seen at the Show, such as belt punches, tyre levers, repair outfits, and lastly, but by no means the most un- important, the round-topped Dunlop belt.

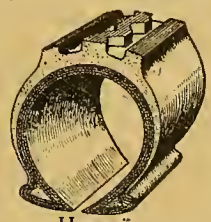
GOODRICH.

These American tyres are built up on a heavy casing, reinforced beneath the point of road contact. Skidding is guarded against by the Safety Tread pat- tern, which consists of thick parallel rubber bars longitudinally disposed, with a crossbar on each series of three.

Dunlop.



Goodrich.



Hermetic.

HERMETIC.

Specialities of this name are shown by the Self-sealing Rubber Co., of Bir- mingham. A heavy motor cycle cover is being made, known as the Z Peerless. It is moulded on a heavy four-ply casing, and is manufactured on motor car lines. A 28×3in. model is being introduced, suitable for American size rims. Amongst the large selection of patches, rubber- faced canvas for cover repairs, and motor cycle belts, we noticed a decidedly prac- tical horn bulb. This is reinforced with canvas insertions and additional rubber moulded at the neck, where vibration usually has such deleterious effects.

HUTCHINSON.

Studded and the popular three-ribbed treads are used on Hutchinson tyres, and it is interesting to note that Pike, on the recent Inverness-Land's End run, used tyres of this make on his O.K.-Union machine.

JOHN BULL.

The Leicester Rubber Co. exhibited a comprehensive range of John Bull tyres and accessories, including their famous cross groove and rib-stud covers, which are extremely heavy and suitable for powerful machines. While somewhat similar to a three-rib tyre, the rib-stud has its ridge interrupted at intervals, so that long studs are formed. A lighter and cheaper cover may be made early next year. Amongst other things which are manufactured under the John Bull name are the new pattern cushion grips for handle-bars, which were very popular amongst competitors in the Six Days Trials. Riders of belt-driven machines will be interested in a new belt fastener, which is fitted with leather pads at the sides of each end, thus preventing click- ing on the pulley and eliminating wear of the belt ends. Used in conjunction with the John Bull deep drive belt, an exceedingly efficient drive should be obtained. Also amongst items not to be overlooked is Mend-a-Tear, the handy repairing material for rents in all kinds of fabric, such as raincoats, overalls, or clothing of any description.

KEMPSHALL.

Having a fabric base of special construction and a tread justly famous for its anti-skid and non-slip properties, the Kempshall tyres have earned a truly famous reputation. Their successful use on the machines of the winning teams in four Six Days Trials is greater testimony to their ex- cellence than anything we can say. All standard motor cycle sizes are offered; a new oversize cover is being made for 650×65 mm. rims, and it should be very acceptable to owners of high-powered outfits; the dimensions of this cover are 700×85, and it is a really sturdy speci- men of tyre manufacture. Another over- size cover by the same makers is the 26×2¼in. for the 2¼in. rim, and this we believe to be only one of its kind. Riders of old-type machines which are under- tyred and fitted with small rims would do well to make a note of the above.

Tyres at the Show.—

KERRY.

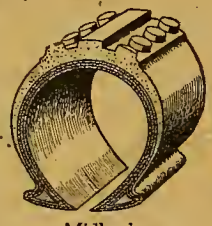
Marketed by the East London Rubber Co., the Kerry motor cycle tyres have long held a name of repute for excellent quality. They have a heavy tread of satisfactory anti-skid properties and are built upon various weights of canvas casings. Suitable inner tubes are also supplied, and a comprehensive range of sizes is manufactured.

MACINTOSH.

Only one motor cycle tyre is at present manufactured by Chas. Macintosh and Co., Ltd., but another heavy moulded pattern will shortly be placed upon the market. The tyre which was exhibited is known as the Anti-skid, and is of particularly robust construction, with a tread composed of two ribs enclosing a series of long rubber studs, which are of peculiar shape, resembling obtuse-angled V's, with one arm parallel to, and the other crossing, the tread at an angle.

MAX.

Several motor cycle tyres are manufactured by Chas. Cuthbe and Co., Ltd., amongst them being the Cycar, having a heavy grooved tread with a central row of elliptical studs; the Combination, having T shaped rubber projections combined with steel studs; and the Mileage, which has a car type of cross-grooved tread. The same company also manufactures, amongst other rubber accessories, the Silverstreak belt, which is built around a canvas core, each layer of which is insulated from the next by an appreciable thickness of rubber. We noticed that a great variety of repair outfits were put up by this firm, and it was evident that the practical rider's requirements had been studied, since generous supplies of solution and also some excellent long strip patches, suitable for dealing with bursts and slits, were included.



Midland.

MIDLAND.

A standard range of covers, inner tubes, and belts is manufactured by the Midland Rubber Co., Ltd., of Birmingham. Three-ribbed treads and also a pattern with a central rib between two rows of studs are applied to the four-ply Midland casings, while the two and three-ply Britannic covers are of the standard studded pattern. Inner tubes are, of course, supplied, and attention must also be drawn to the excellent belts offered under the Midland name.

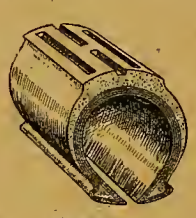
MOSELEY.

The products of this Manchester house are undergoing no change, their success in the past having fully justified the reputation gained during the makers' long experience of tyre manufacture. Various popular tread designs are made, and an extensive range of sizes and weights is available.

PALMER.

All the usual range of Palmer tyres, together with endless and butted tubes,

Kerry.



Macintosh.

are being manufactured by the Palmer Tyre, Ltd., and, in addition, a 16×2⅜in. scooter pattern has been added. The last-mentioned is of the three-rib type, on a four-ply canvas casing. Owing to the success of the Palmer Cord Combination cover in the smaller sizes, a 28×3in. model has been added to the list; the tread has two outer ribs of solid rubber and a central row of steel studs, and is admirably adapted to the heavy side-car machines which are now being fitted with this size and section. In addition

Moseley.

Palmer Cord.

to the well-known Cord tyres in the standard sizes, various cheaper patterns are made on different thicknesses of canvas casings, and they are suitable for all types of motor cycle from the light-weight solo machine to the heavy passenger outfit.

PEDLEY.

Every variety of accessory suitable for the motor cyclist that can be made in rubber is manufactured by J. Pedley and Sons, of Birmingham. One of the special lines is the Pneumatic Handle-bar Grip, which is supplied complete with the necessary fixing tape for attaching to the bars. It gives a particularly flexible and comfortable grip w eliminates the greater portion of vibration which is not absorbed by spring forks. Other lines are thre tyres in light, medium, and h weights, and a full range of belts, hubs, and motor cyclists' weather suits are also offered. The Pedley t are extremely sturdy, and, although are not cheap in price, their servic such that true economy is the ri of their selection. Belts also manu tured by this house are superio quality, and per excellently on ably-geared mach

Max.

RICH DETA ABLE TUBI

These excellent tachable tubes, w incorporate handiness of butted tube with advantage of an less air passage, shown by the Thames Rubber Leather Co. Having been many y on the market, they have proved t efficacy many times, both in private and in competitions. Although are so well known as almost to need detailed description, it may be wel remind the reader that the joint of tube is made by means of thickened slightly "undercut" rims at the of the tube. These are smeared wit lubricant provided, one inserted wi the other, when the internal pres after inflation h the joint.

Pedley.

ROBERTS.

A great variety tyre accessor is manufactured Alfred Roberts Sons, Ltd., and range should gre interest the m cyclist. Excel repair outfits made up, also handy boxes of du patches and both inside and outside gaiters. The latter are clipped u the bead, and form a most useful for any rider who undertakes journeys, or who runs his covers to state of absolute breakdown.

ROM.

Large studs of rectangular form, rubber bars, and a combination of latter with steel studs comprise the t patterns of Rom tyre treads. T covers are extremely heavy, and have excellent thickness of rubber where is most needed. Powerful canvas cas are used, and in the round-base voitur sizes the driver of a heavy three-whe will find that he has a sound investm

WOOD-MILNE.

An advantage of the Wood-M tyres, in both Combination and Key- patterns, is that while they presen continuous surface in contact with road, a practical anti-skid design is corporated. Unlike many firms, makers are laying themselves out for requirements of the scooter manu turers, 16 and 18×2⅜in. sizes being offe

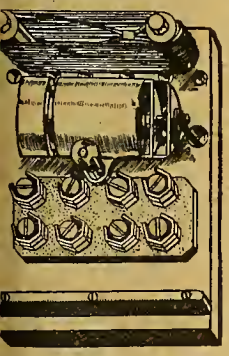
Electrical Equipment at Olympia.

A Short Survey of Lamps, Magnetos, and Plugs.

ADVANCING years and an increasing love of comfort lead one to seek with deep interest for anything that can ıooth the way of the motor cyclist, and ld to the ease and pleasure of riding. ıll electrical equipment has arrived in e car world, and to go back upon its lights is unthinkable. Modern progress ints towards the ultimate achievement a similar position also in the motor cycle world.

P. and H.

In surveying the excellent variety of ectrical equipment in the Gallery, one turally considered whether, by the time l desirable items had been fitted to ıe's machine, it would be grotesquely er-burdened. On the stand of Messrs. owell and Hanmer, however, a 4 h.p. ouglas was shown fitted up with their ectric lighting outfit, the whole equipent being remarkably neat and incon-icuous. The dynamo is fitted in front low the down tube, and driven by a hittle belt from a pulley on the outside the flywheel, and the accumulator box ıd special junction box are located, the one in front and the other behind the seat tube. The dynamo, it will be recollected, is fitted with a very ingenious patent clutch, which ceases to drive automatically when a certain predetermined output has been exceeded. A feature of this lighting set is the neat arrangement of the combined ammeter and vitch on the top tube, the latter affordg positions whereby either full light dim light may be used.



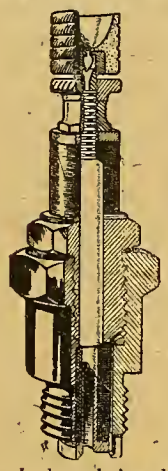
Internal arrangement of the P. and H. accumulator junction box.

Lodge.

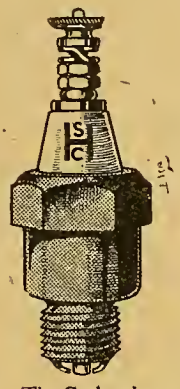
Of the full range of Lodge plugs shown Messrs. Lodge Plugs, Ltd., the most teresting is naturally the new model .E.P. priming pattern. The model, hich is made specially for motor cycles, is very small and neat, and is lapted either to replace or to supplement the usual sparking plug, and may so be used in the position of the compression tap, its length being such that will even fit in under the top tube of ost vertical single-cylinder machines. he construction is simple; the priming alve can be opened easily by hand, and not likely to leak. The standard model 3 Lodge plug, which is made in two ieces only, and can be very easily taken part for cleaning purposes, also naturally ppeals strongly to those who prefer a lug which can be readily dismantled and eaned when occasion arises.

Miller.

On the stand of H. Miller and Co., Ltd., was exhibited their new patent self-regulating dynamo, which is another welcome addition to the number of neatly-designed and readily adaptable instruments for motor bicycle use.



The Lodge priming plug.



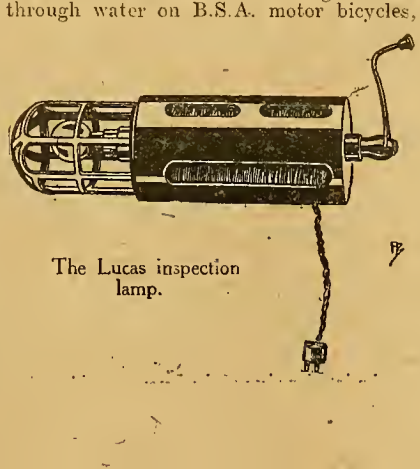
The Cooke plug.

Smith.

A six volt set, designed for sidecar use, including three lamps and an electric horn, was shown by S. Smith and Sons, Ltd., adapted to a 6 h.p. Blackburne and sidecar. The dynamo fits neatly in front of the front down tube, whilst the accumulator box is carried on the left footboard, and the electric horn is mounted on the front stay connecting the sidecar with the motor bicycle. We were given to understand that the makers are still experimenting with these sets, and modifications in design may be expected in future patterns. The dynamo is of the self-regulating type, and a neat design of centrifugally controlled cut-in is incorporated in the machine.

E.I.C.

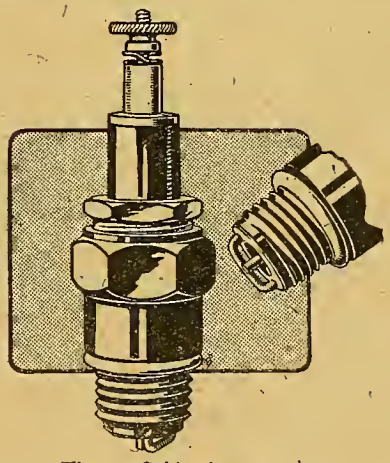
Passing further along, one next arrived at the stand on which E.I.C. magnetos in considerable variety were displayed. It will be remembered that these magnetos have performed some very remarkable feats of endurance in being driven through water on B.S.A. motor bicycles, which tests were carried out quite independently of the makers of the magneto, who had no special intention of guaranteeing that their machines would spark under water. The principal difference in the various types made by this firm is in the base, which is altered to render the machines adaptable to different makes.



The Lucas inspection lamp.

Sphinx.

One could not pass by the Sphinx stand without being arrested by the very remarkable and admirable scheme of decoration, which was suitably set off by an enormous scale model of the Sphinx sparking plug in the centre of the stand. The firm make sparking plugs in great variety, claiming that they can provide the necessary ignition point for every kind of machine, ranging from the smallest scooter to the largest tractor. Two new designs are now upon the market, differing only in the nature of the material used. The feature of this plug, the Bar-type, is the design of the firing points, which are so formed as to give the hottest possible spark when the magneto is running slowly and its impulse is at its weakest. The two models are the "Steatite," which is the general purpose plug, whilst a mica insulated type is recommended to be used where excessive heat or vibration is involved.



The new Sphinx bar type plug.

Cooke.

Upon the opposite side of the Gallery one next perceived a very full and complete range of the Cooke sparking plugs. In this case, also, the makers provide a plug for every form of vehicle from the smallest to the largest, and in great variety as regards length of body and length of screw thread.

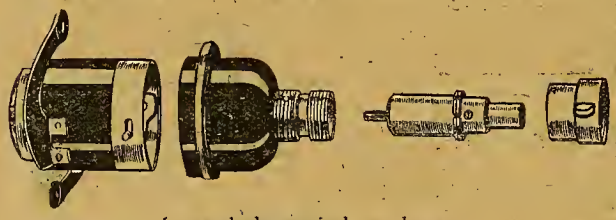
M-L.

Another exhibit which arrests the attention of the electrical enthusiast was that of M-L magnetos, and the merely curious onlooker with no special interests was invited to light his cigarette at the flood of sparks which were being poured

Electrical Equipment at Olympia.—forth from one of these machines running on this stand at a speed of 3,500 r.p.m. The testing of magneto armatures was also displayed on this stand, the standard test being carried out at 15,000 volts and a frequency equivalent of 2,000 sparks per second, conditions the severity of which at the present time, it may be remarked, are never even approached in ordinary running. One special feature of these machines is the design of the condenser, in which rectangular mica plates are used; also the very neat and compact little boxes of spare parts which were exhibited could not fail to attract the attention of all those who seek to equip themselves against every possible contingency.

Oleo.

All motor cyclists of long experience are familiar with the Oleo plugs, and the latest designs shown at Olympia displayed still further advance on the well-known reliability of these old friends. The Oleo weatherproof terminal is particularly neat and handy, and provides an instantaneous method of connection to any plug fitted with a spigot end. Particular care has been taken to make it proof against vibration. The Oleo motor cycle plug, No. 2, is guaranteed to be gas-tight, as is



Lucas single terminal rear lamp.

tested to withstand a pressure of 200 lb. per square inch in every case.

Lucas.

The principal attraction on the stand of the Lucas Electrical Co., Ltd., is, naturally, the combined lighting dynamo and magneto, which is a concentration in one compact machine of two entirely separate instruments. By swinging aside the strap over the commutator cover the dynamo may be instantly withdrawn intact from the machine, the magneto portion of which remains and acts independently. Thus, if it is desired to mount the dynamo separately from the magneto such an arrangement is still possible with this combination. The complete Magdyno set for sidecar use formed a very attractive exhibit. Also shown was the full range of the Thomson-Bennett magnetos, a particularly neat and attractive example of which is the Midget single-cylinder magneto, intended especially for lightweight engines up to 2½ h.p. The question of weight in electrical equipment, it may be added, is one which is naturally deserving of special study, since the tendency for a long time has been for the weight of motor bicycles to go up, owing largely to the somewhat elaborate equipment which is now demanded. Those who favour the lightweight look eagerly for examples of electrical equipment in which weight has been reduced, as in this case, to a minimum.

Hunt's handle-bar magneto cut-out.

C.A.V.

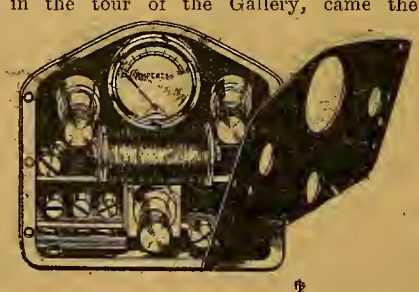
Perhaps the most cheering exhibit in the whole Gallery was that of the C.A.V. magnetos. A really large number of these instruments was displayed upon the C.A.V. stand, truly suggestive of the mass production which the firm is undertaking. Twelve of these magnetos were shown running, and a thirteenth delivering a large number of sparks round the circumference of a revolving ring. A new motor cycle type of head lamp with a special aluminium bracket is also being made by this firm, which will maintain the admirable reputation already achieved by its products. The new C.A.V. magnetos are of the single magnet type and totally enclosed. The utmost care has been taken to make it impossible for water to enter, and either of the two latest designs is guaranteed to continue sparking under water. The carbon brush holder is worthy of special attention, the holder and terminal being formed in one piece, thus ensuring a secure and absolutely waterproof electrical connection.

Xl'All.

Xl'All detachable plugs were shown in full range on the stand of the manufacturers, Messrs. Xl'All, Ltd., Hall Green, Birmingham. The features of this design are that the central electrode can be removed and cleaned with great expedition. A large insulating surface is provided by the porcelain, thus obviating the chances of shorting in wet weather. Three different designs of electrode are manufactured, one being for general purposes, another recommended for use in high compression and hot running engines, whilst the third is intended for cool running water-cooled engines.

Hunt.

Last, but by no means least in the matter of electrical accessories displayed in the tour of the Gallery, came the



An interior view of the Lucas switchboard.

stand of Messrs. A. H. Hunt, on whic an exceedingly interesting range equipment was shown, including not few real novelties. We are asked state that this firm is moving into larg works, and that there will be a chan of address after Christmas, the ne address being H.A.H. Works, Tunst Road, Croydon. The well known ar proved Hellesen hand lamps were show together with a full range of Helles dry batteries. Complete electric lighti sets with either accumulators or d batteries are also made in variety adap able to any type of solo machine or sid car outfit, but to one interested in au to the easy maintenance of a machin perhaps the most interesting items exh bited were the H.A.H. wiring sundri and the new variety of insulating ta of only ¼in. width. How often has th writer not found the standard tape t too cumbersome for some finicky job th had to be done? The new handle-b or top tube lamp switch, with its simp positive screw contact, is also a ve practical innovation.

F.R.S.

Though not a dynamo set in the tr sense of the term, a very simple ligh ing outfit is supplied by the makers the well-known F.R.S. lamps. Exce current from the magneto is employe

Hunt's plug protector and terminal attachment.

and, after passing through the necessa damping arrangement, lights a head a tail lamp. The lamps are of ne and sound construction, but somewh less bulky than those of the avera dynamo set. The necessary coil housed in a neat black finished bo which may be attached to the tank ra or other convenient spot. The box al contains a small accumulator to provi light when the machine is stationar Four-volt bulbs are fitted, but a tw volt accumulator is supplied, so that t light produced when the engine is n running is dimmer. One of the adva tages of this system is that no mechanis or driving gear is needed, and it is on necessary to find room for the sma accumulator box. The price of the hea and tail lamp, three-way switch, accum lator, coil, and all necessary fittings f a motor cycle set is £6 3s. 6d.

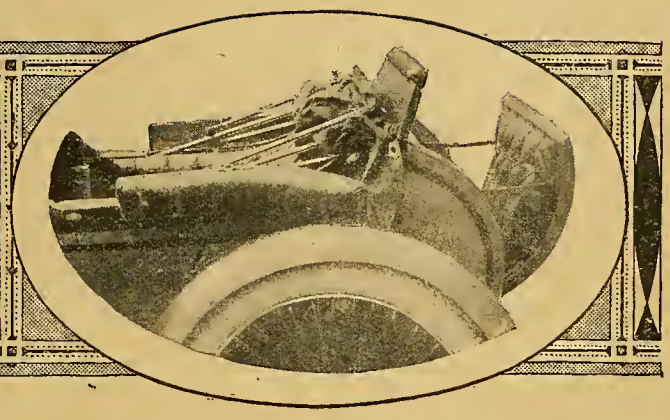
B.L.I.C.

Eight types of the B.L.I.C. magne were exhibited by the British Lighti and Ignition Co., which, incidentally, a branch of Vickers, Ltd. The mode shown included those suitable for ligh weight single-cylinders, lightweight fl twins, large V twins,

Having had enormous experience magneto manufacture, and possessing works organisation extending back to t earliest days of magneto manufactur this company is in a very favourab position, not only in regard to productio but to repair work, which it also unde takes.

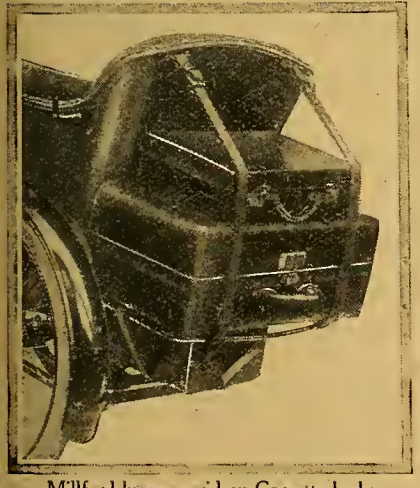
MODERN SIDECAR DESIGN.

A commentary on the constructional details of passenger attachments at the show.



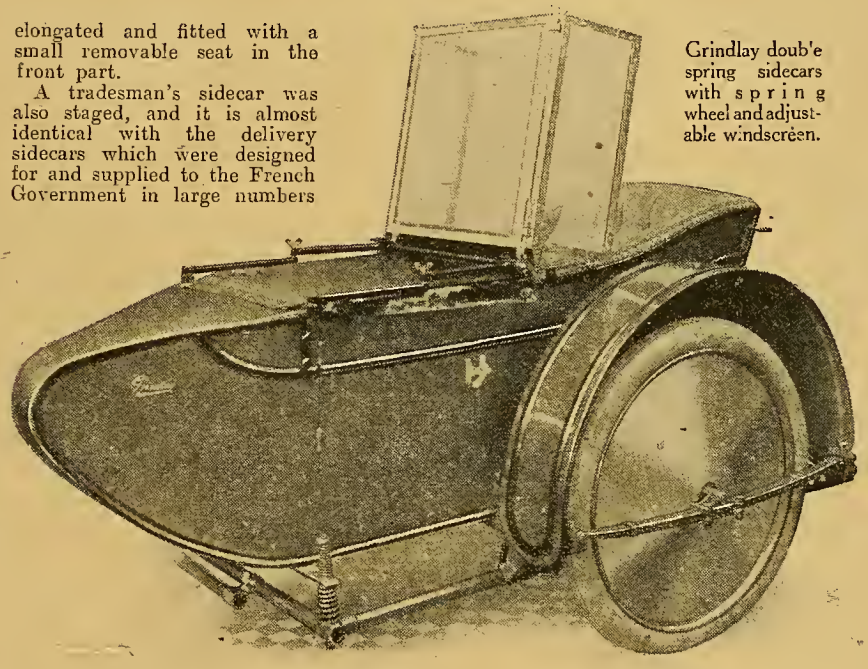
MILLFORD.

MILLS-FULFORD., LTD., Crown Works, Coventry.—Mills-Fulford, Ltd., are one of the oldest established sidecar manufacturing firms in this country, and they exhibited an extensive range of all types. The well-known Millford light chassis, while retaining the straight axle, also permits quite a low body position. To those who possess high-powered machines and desire the utmost luxury and strength in the passenger attachment, the *modèle de luxe* will especially appeal. All the chassis tubes of this sidecar are duplicated with the exception of the front cross member, while the diagonal stay from the seat lug of the machine to the axle is adjustably secured on the latter by a double clamp which divides the stresses equally between the two tubes. The coachwork on this model is of the most elaborate order, and the upholstery is edged with aluminium beading. Luggage accommodation, morever, is provided for in a remarkably neat and unobtrusive manner. Behind the seat the bulbous back of the body is hinged and may be lowered and secured in a horizontal position by the same straps which are used to hold a suit case or whatever other luggage may be carried. When out of use the existence of this luggage carrier is quite unsuspected. Amongst other models shown was the "Family" double-seated sidecar, which follows the general lines of the Corvette, but is suitably elongated and fitted with a small removable seat in the front part.



Millford luggage grid on Corvette body.

A tradesman's sidecar was also staged, and it is almost identical with the delivery sidecars which were designed for and supplied to the French Government in large numbers during the war. The body is not particularly attractive in appearance, being merely a large wicker box with a removable lid, but the carrying capacity is exceptionally great.



Grindlay double spring sidecars with spring wheel and adjustable windscreen.

GRINDLAY.

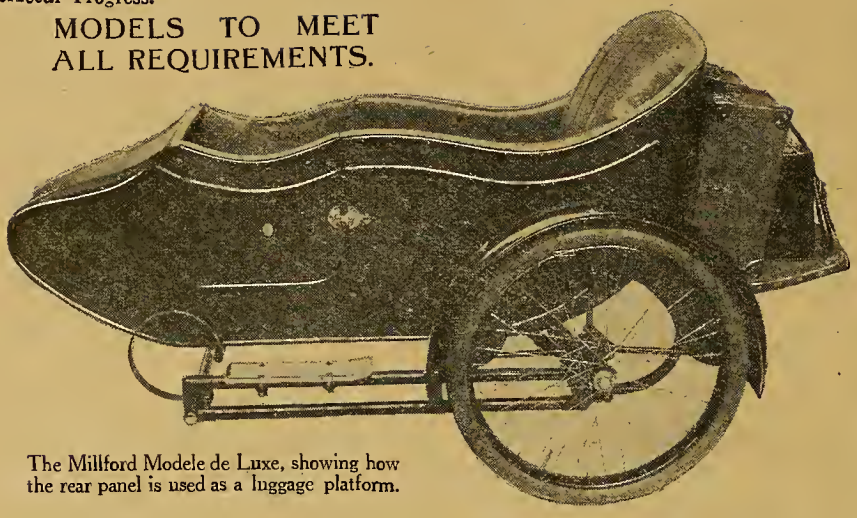
GRINDLAY SIDECARS, LTD., Spon End, Coventry. — Six Grindlay bodies were shown, and five of these embodied the well-known spring suspension of this make. The wheel is carried between two long semi-elliptic springs, these being shackled at the rear. By this method all unsprung weight is eliminated except that of the wheel itself. The standard bodies are sufficiently roomy easily to accommodate a full grown passenger in addition to a child, and, owing to the efficient system of springing, no excessive strain is thrown upon the motor cycle or the connections by such extra loading. A new type of luggage carrier has been fitted to the body in place of the one formerly attached to the rigid part of the chassis, and a simple and convenient petrol can grip is located under this. One especially luxurious body was fitted to a Harley-Davidson outfit, and this has a mahogany framed windscreen with folding side panels, which may be adjusted at various angles and inclinations across the front of the sidecar by means of the double-jointed arms on which it is supported. The upholstery on this model was worthy of the highest class of car, being carried out in a cord cloth beautifully patterned in grey and brown.

SANDUM.

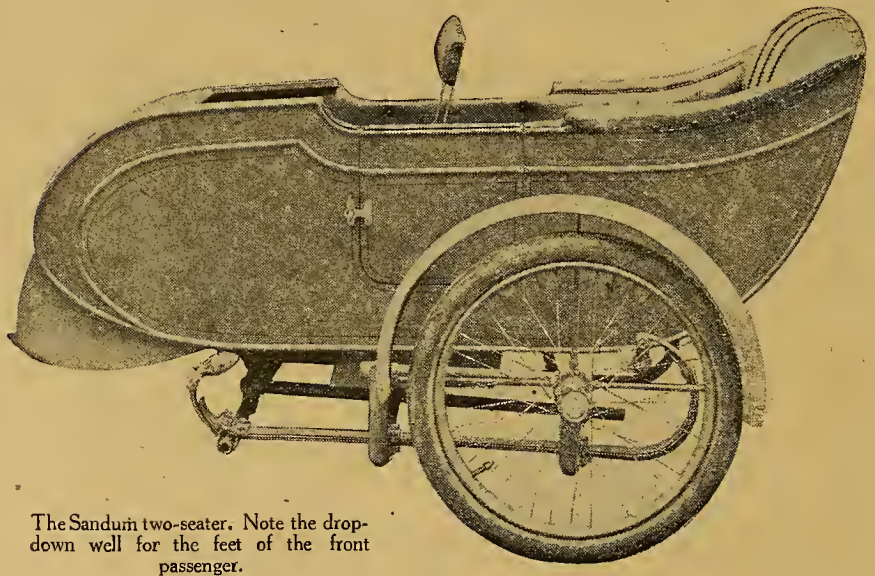
THE SANDHAM ENGINEERING CO., 336, Gray's Inn Road, W.C.1.—Double-seated sidecar bodies are a speciality of the Sandham Engineering Company, a special type of chassis being manufactured. This is of underslung construction, and has two sets of C springs, one before the other, so that there is a bearer bar underneath each passenger. Since a double-seated sidecar is not always fully occupied, the firm have designed a shorter body which is readily convertible to the single-seated model. The accommodation is almost equally as good as in the larger one, owing to the fact that the dash over the front seat is cut away

Sidecar Progress.—

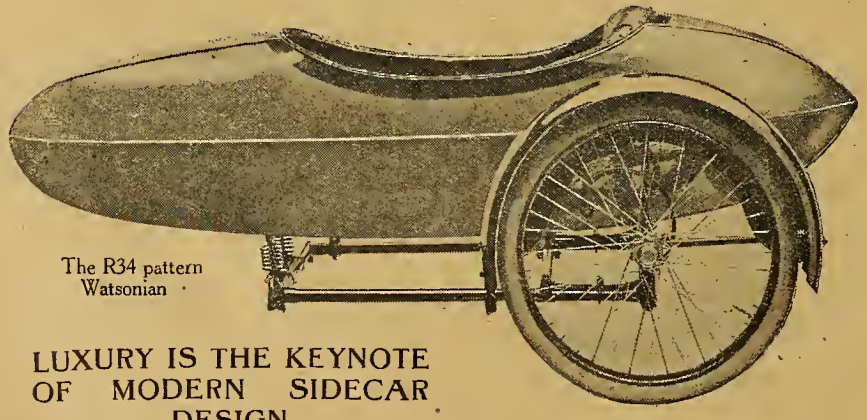
MODELS TO MEET ALL REQUIREMENTS.



The Millford Modele de Luxe, showing how the rear panel is used as a luggage platform.



The Sandum two-seater. Note the drop-down well for the feet of the front passenger.



The R34 pattern Watsonian

LUXURY IS THE KEYNOTE OF MODERN SIDECAR DESIGN.

to give the foremost passenger ample room. When the single seat alone is required, the one at the front is taken out, folded up and reversed, when it slides along runners at the sides of the front of the body, and acts as a panel, filling the cut-away space just mentioned. The touring model attracted a good deal of attention amongst prospective lady passengers, by virtue of the fact that the flap of the small locker in the front of the sidecar was fitted with a mirror. Also shown on this stand was a very original sidecar windscreen.

WATSONIAN.

The Watsonian Folding Sidecar Co., Conybere Street, Birmingham.—Featherweight, Tourist, Coupé, Semi-sporting, and Sporting models were exhibited by this well-known firm of sidecar specialists. Little alteration has been found necessary in the Featherweight model, the chassis of which is of the simplest construction. The body is extremely light, and is supported by large compound springs similar to those used on the Brooks saddle. It is essentially a passenger attachment suitable for low-powered machines. The Tourist and Semi-sporting models follow conventional lines, and are fitted on a very substantial underslung chassis. The Coupé, however, is a new type, and offers very complete protection against the weather. Scuttle dash, screen, side windows, roof, and hood form one unit, which is hinged at the back of the seat and secured at the front by a catch, and in order to enter the sidecar it is merely necessary to swing back the whole assembly as one piece. The screen and side windows cannot be removed, but the roof and hood, which are of leather-faced material, may be quickly detached. By unscrewing the wing nuts, the upper part of the coupé may be removed completely, leaving a body of the normal open type. Behind the seat a long extension of the body forms a boot in which it is possible to carry petrol cans and spares. The top of this receptacle is covered with aluminium, and is sufficiently large to accommodate a large suit case. Another new model is the R.34. This is of an extremely low and racy torpedo shape; no side door is fitted, but a step is situated on the side of the chassis, thus permitting easy entrance.

BAMCO.

Birch Aircraft Manufacturing Co., High Road, Willesden Green, N.W.10.—Bamco sidecars manufactured by the Birch Aircraft Manufacturing Company are amongst the few from which the ordinary type of brazed lug construction is eliminated, since they are made entirely of heavy steel tubing suitably mitred at all the joints and acetylene welded. Wheel springing is carried out in two entirely different ways. The first method, which was to be seen on the No. 4 Modèle de Luxe, is somewhat similar to that recently described in *The Motor Cycle*, and consists of a fork hinged at the rear of the frame and supported at the front by two shackles at right angles to each other, and bridged by spiral springs which are hooked on; they are thus easily replaceable in the unlikely event of breakage. The springing of the body itself is effected by coil

Sidecar Progress.—

springs working in cylindrical housings, and exceptional shocks are provided against by rubber buffers at the base of these. On the second spring wheel model a large half-elliptical spring swung on a bracket in front of the wheel and a shackle at the rear carries the lug which holds the stub axle. This is an extremely simple arrangement, and promises to become one of the firm's most popular features. The bodywork on the Bamco sidecars is exceptionally fine, only the highest class of coachwork and finish being used throughout. Prices in consequence are somewhat higher than usual, the figures for the No. 4 model being £45 to £50, according to the finish.

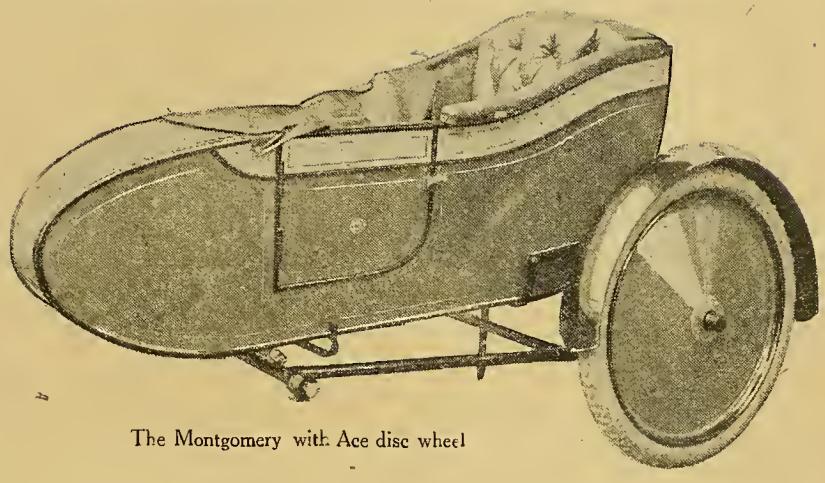
MONTGOMERY.

W. Montgomery and Co., Lower Ford Street, Coventry.—Twelve models of Montgomery sidecars were staged, and almost without exception they embodied a simple chassis with a straight rear axle. Dropped below this is another cross-member, from which lead the main tubes; these converge towards the front. Four-point attachments with connections of the nut and union type are used. Great variety is displayed in the style of the bodies which are sprung on C springs at the rear and S shaped coils at the front. A comprehensive range of additional fittings can be supplied with Montgomery sidecars, such as windscreen, hood, and luggage grid.

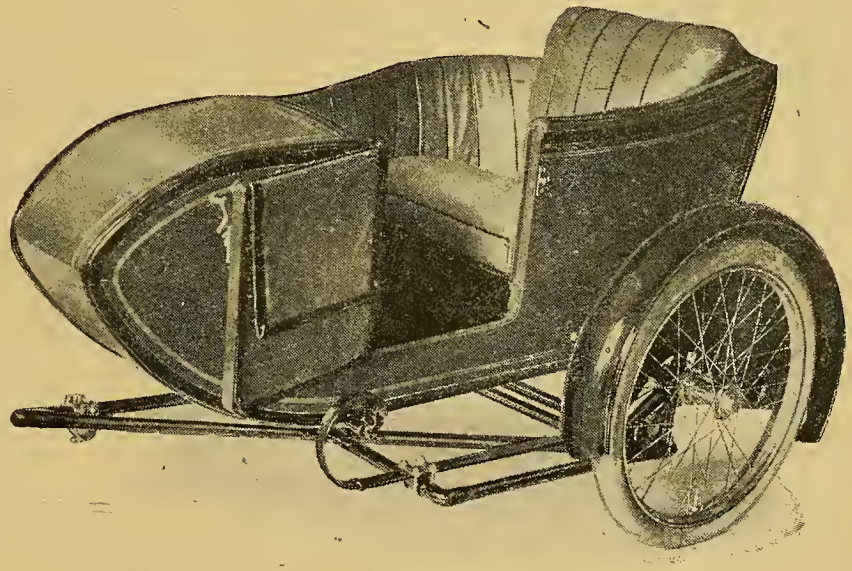
DUNHILLS.

Dunhills, Ltd., Euston Road, N.W. —Three models of Dunhill chassis are made and the same general principle is followed in all of them. The essential feature of the design is the employment of a tube running from the front connection to the lug which holds the hub spindle. In plan view, therefore, the chassis has the form of a right-angled triangle, the axle representing the base, the longitudinal member being parallel to the motor cycle, and the remaining tube forming the hypotenuse. According to the weight of body, requirements of spring fixing and power of the machine modifications are made by the addition of extra cross-members; also three, four, and five-point connections are used as required. Wheels in all cases are detachable, in the simpler models being fitted with a cone and nut fixing of the axle, while the mudguards may be readily removed. On the heaviest chassis the wheel is completely surrounded by a frame, and on removing the mudguard, which is quickly detachable, and reversing one of the stays which acts as a stand, the wheel may be lifted out from the top, thus avoiding any lifting of the chassis.

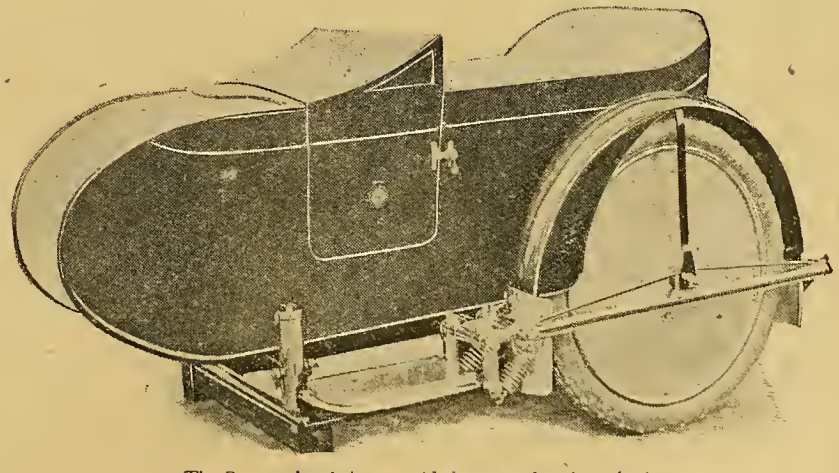
Various types of bodies are fitted, one which is extremely original being of the sporting type, bulbous in form, and without side door. The passenger reclines in a deep comfortably padded well in the interior and is protected by a small windscreen. Also small lightweight bodies, a handsome purple finished touring type with hinged dash and very complete equipment. The later model is extremely light for its size and luxury, the total weight being only 140 lb. with all fittings.



The Montgomery with Ace disc wheel

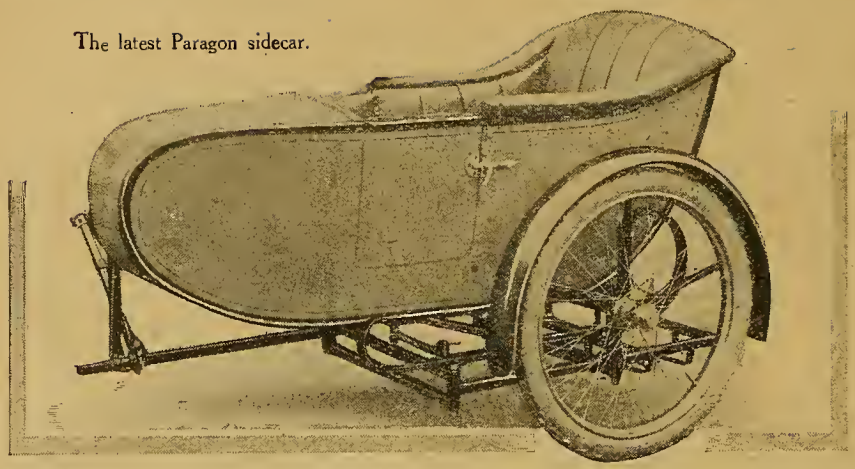


A Dunhill family sidecar. Note the method adopted to obtain an extra wide seat to accommodate adult and child.



The Bamco chassis has a welded joint and spring wheel

The latest Paragon sidecar.

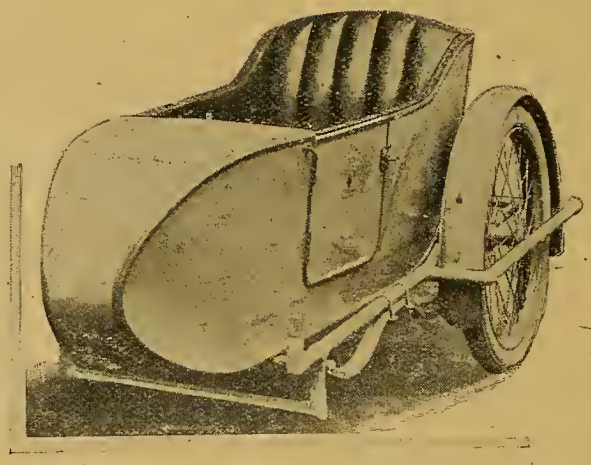


PARAGON FOLDING SIDECAR.

WINCYCLE Co., 236, High Holborn, W.C.1.—We have previously referred to the Paragon folding sidecar, which is a great boon to all those motor cyclists who have not wide entrances to their houses or gardens. When folded up, the motor cycle and sidecar chassis will pass through a 30in. doorway. It also possesses another feature, and that is the fact that the body is very quickly detachable, so that the tradesman may use the machine for delivering goods during the week and as a sidecar outfit over the week-end. The latest pattern is fitted with a comfortable and well upholstered body. The long side member of the sidecar chassis is now in one piece, and the lugs in the latest models are at the sides of the members, so that the bolts do not pass through the tubing; and the axle is now underslung.

HENDERSON.

HENDERSON SIDECARS, LTD., Fitzwilliam Street, Sheffield.—This exhibit was undoubtedly one of the most interesting in the Show, since the maker of the Henderson sidecars has designed his products not only from the practical, but also from the theoretical, standpoint. A special feature of all the chassis which were shown on this stand is the employment of steels of varying specifications, according to the nature of the stresses which they are called upon to resist. Thus, all the bright parts are of stainless steel, while special high tensile metal is used in the axles and bearings. All moving parts are fitted with bronze bushes, and even a special process is used in order to secure perfect uniformity in the malleable castings which form the lugs. A new type of spring wheel is shown, and this achieves a point often sought by designers, namely, the elimination of the bulk of the unsprung weight, only 11 lb. dead load being carried by the axle. All the touring Henderson bodies are equipped with a large locker behind the seat, and accommodation for luggage is provided on the top of this. On the heavier models 8in. car type domed mudguards are used, and these are sprung with the body. A further novel feature of the Henderson construction is the type of frame attachment. This consists of a heavy casting with a taper hole at one end, corresponding to the conical projection on the clips which are attached to the machine. At the outward end of this casting are two small set-screws, which project within the bore, and passing between them is a long sleeve nut operated by a tommy bar and having the outside diameter of its central portion somewhat reduced. When screwed up this nut draws the casting tightly on to the frame lug, making an extremely secure connection. When it is desired to detach the sidecar, the nut is unscrewed until the shoulder of its larger diameter abuts against the above-mentioned set-screws, when it withdraws the casting from the cone, thus enabling the sidecar to be easily removed without hammering or any other violent means being employed. Others models on this stand are the well-known Featherweight, which has



On the Williamson sidecar, the springing is effected by double-ended laminated springs.

A Dunhill sidecar screen with side wings, which are adjustable in any position.

Sidecar Progress.—

an extremely light triangulated chassis and three-point suspension, and the Model B, which is a somewhat heavier pattern, suitable for 3½ and 4 h.p. motor cycles. The springing of the body on the latter is somewhat unusual, short quarter-elliptic springs being fixed almost vertically on the rear axle, and the body is hung from these on a type of coil spring shackle which is adjustable. A further model is the Elite. This is suitable for high-powered machines, and embodies most luxurious detail fittings. The accommodation for the passenger is extremely roomy and comfortable. A large luggage locker is fitted at the rear, and, as an example of the manner in which detail is studied on this attachment, the lock is of special construction, in order that it may hold the lid securely and without rattle when the machine is running. Special fittings are made to render this chassis suitable for Indian and other sprung frame machines.

CANOELET.

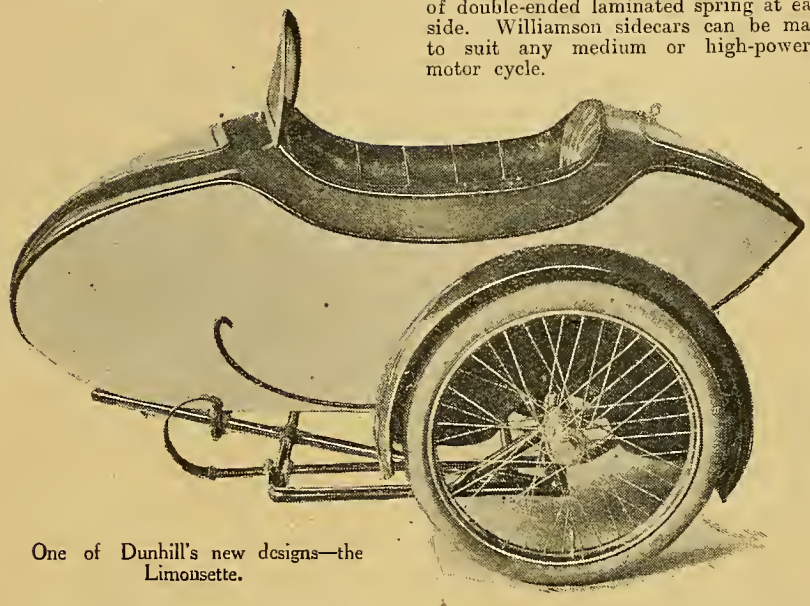
The rear locker and spring grid are now regarded as essentials on the modern sidecar. An excellent example—the Rover.

wood, being entirely new and a great departure from conventional practice. The axle is a steel stamping of H section, and the chain stay connection and wheel axle are held in conical housings. Springing of the acetylene-welded sheet steel body is effected through a link action controlled by a single adjustable tension spring. Other types shown include the famous Canoelet Minor sporting model, while some ingenious luggage and petrol tin openers are also exhibited, the latter being of such a form that two tins could be securely fixed in addition to other packages.

TRIUMPH (GLORIA).

GLORIA SIDECAR CO., LTD., Coventry.—Gloria sidecars were shown on the new chain-driven Triumphs, and these embody the well-tested wheel springing arrangement which is extremely popular. Incorporation of sidecar fixing lugs in the motor cycle frame has simplified the attachments, which are particularly neat. Another new feature is a sprung luggage platform, covered with rubber matting, fitted at the rear of the chassis. No comment is required regarding the excellent appearance of the Gloria purple coachwork.



One of Dunhill's new designs—the Limousette.

CHATER-LEA.

CHATER-LEA, LTD., 74-84, Banner Street, E.C.—Both light and heavyweight sidecars were shown, and these were on conventional lines. The heavy model has an extremely substantial duplex chassis.

SIDECAR BODY CO.

SIDECAR BODY CO., 25, Upper Clapton, E.C.5.—A variety of bodies was shown by this firm, ranging from conventional light and mediumweight types to an extremely novel projectile model. This was constructed of aluminium, cylindrical in form, with a pointed nose, and having a broad copper band immediately behind the seat.

WILLIAMSON.

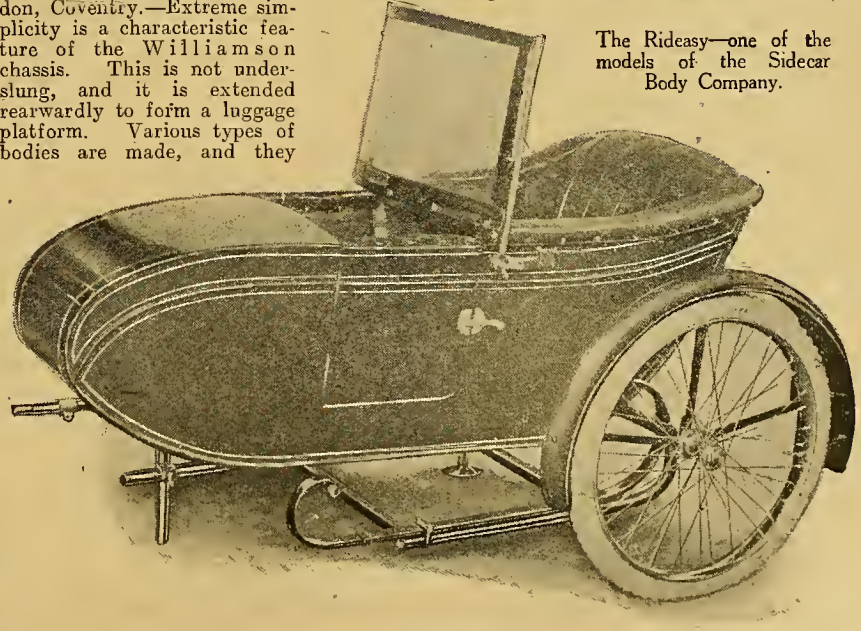
WILLIAMSON MOTOR CO., LTD., Earlsdon, Coventry.—Extreme simplicity is a characteristic feature of the Williamson chassis. This is not underslung, and it is extended rearwardly to form a luggage platform. Various types of bodies are made, and they are carried within the frame by a form of double-ended laminated spring at each side. Williamson sidecars can be made to suit any medium or high-powered motor cycle.

BROUGH.

The sidecar for the 5 h.p. Brough flat twin embodies a neat wheel springing device. The wheel stub axle is carried on a short pivoted link, and a slide at the end of this bears on the underside of a flat laminated spring anchored at the rear of the chassis. The body is roomy, and is carried on C springs at the rear and on a transverse leaf spring hung from two shackles at the front.

REX.

The Rex Chassis construction is extremely simple, and the main portion entirely surrounds the body. The outer portion of the wheel-supporting member is readily detachable, thus permitting the wheel to be withdrawn outwardly without raising the sidecar high above the ground. Four connections are fitted



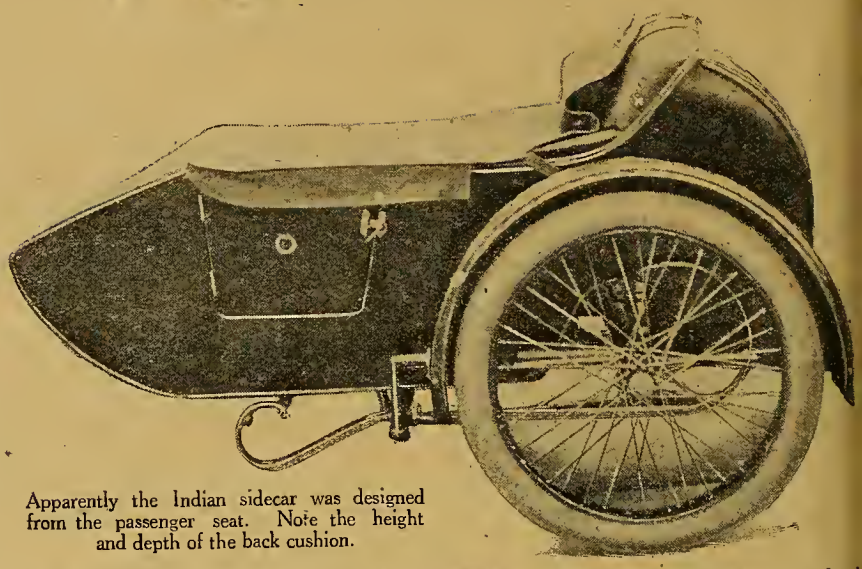
The Rideasy—one of the models of the Sidecar Body Company.

Sidecar Progress.—

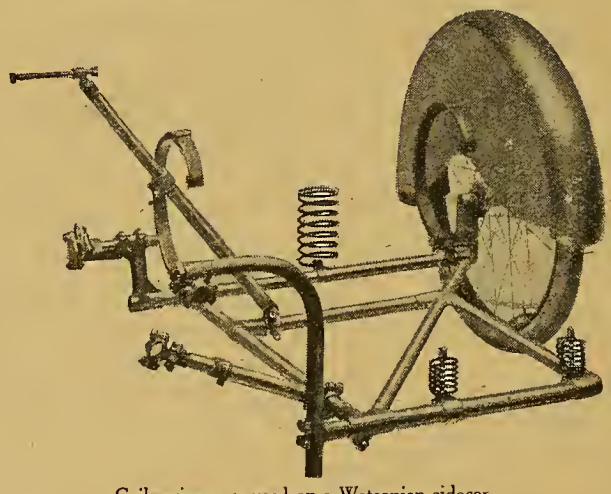
between the machine and sidecar, and the lugs forming the points of attachment are integral with the cycle frame. For the springing, long cantilever springs are used at the front and coil springs at the rear. At the extreme end of the body is a small well, into which the spare wheel drops, and it is thus carried vertically and secured by means of a bolt passing through the hub.

A.B.C.

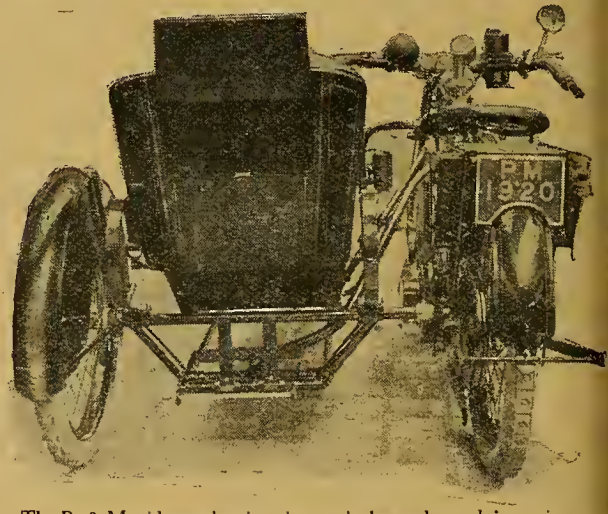
Owing to the enormous amount of interest which has been aroused in the A.B.C. productions, this stand was one of the most largely attended in the Show. The sidecar fitted to the 3 h.p. A.B.C. was the subject of much admiration, since its design is extremely good and on thoroughly workmanlike lines. Rigidly attached to lugs incorporated in the sprung portion of the motor cycle frame, the chassis forms an extension somewhat in the nature of an outrigger, and the rear cross-tube, or axle, is carried at the rear end on two cantilever springs. This tube is also fixed to the chain stay of the machine, by means of a simple



Apparently the Indian sidecar was designed from the passenger seat. Note the height and depth of the back cushion.



Coil springs are used on a Watsonian sidecar.

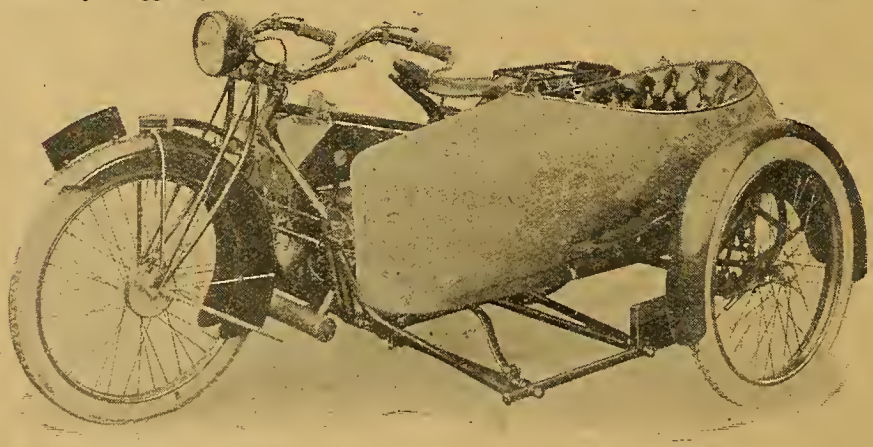


The P. & M. sidecar showing the rear locker and petrol tin carrier.

form of ball joint, in such a way that the rear wheel and sidecar wheel may move to some extent independently. The body is egg-shaped, of polished aluminium, and has no side door, being entered from a step between the cycle and sidecar.

ROYAL RUBY.

The Royal Ruby spring wheel sidecar is characterised by robust construction. Behind the body is a large platform, and here is accommodated the spare wheel and also a petrol tin carrier housing two tins, which are covered by a lid and then secured by a special crossbar, which grips the handles, and is then secured by a tommy-headed screw.



A lightweight body of polished aluminium—the Gracemill attached to an A.B.C.

NORTON.

Very substantial connections are used in joining the sidecar to the Norton "Big 4" motor cycle frame, and particular attention has been paid to luggage accommodation. A most capacious locker is fitted in the rounded back of the body, and a dickey seat suitable for a child can be incorporated.

A.J.S.

A.J.S. sidecars are almost too well-known to need description. A hinged dash, which extends over the front of the body to the level of the seat, carries an adjustable windscreen, which forms part of the standard equipment. In common with the general tendency, the A.J.S. sidecar has a folding luggage platform mounted on the body, so that it has the advantage of the insulation afforded by the springing. The platform is covered with rubber matting, and beneath it is

Sidecar Progress.—

a tool drawer, which is very readily accessible. The spare wheel is mounted immediately behind the body, and is held in position by two special clips, which are clamped firmly on the bead of the rim by means of easily-operated wing nuts.

F.N.

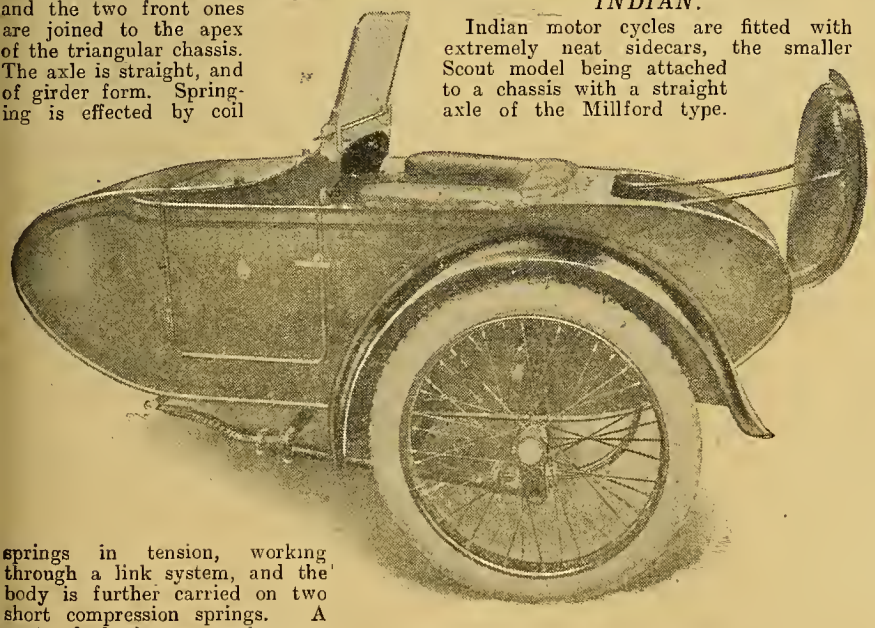
The sidecar shown by the English representatives of the well-known Belgian firm was attached to the new 7 h.p. four-cylinder model. No lugs or brazed joints are employed in the construction, the whole chassis being built up of steel tubes welded together. Three-point attachment is adopted, and the connections are made to sidecar lugs integral with the motor cycle frame. The body itself is of the normal coach-built type.

EXCELSIOR (BRITISH).

Only one sidecar model was shown on the Excelsior stand, and this is a large double-seated pattern on a Millford type of chassis. Single-seated sidecars, however, will be made by this firm. Provision for carrying a spare wheel is made on the folding luggage grid, which is attached to the rear of the body. One of the lugs is drilled and tapped, and the wheel is secured to this by passing a long bolt through the hollow spindle. When no luggage is carried, the platform and the wheel may be pushed close up to the back of the seat, but when the former is in use the wheel lies horizontally, and is out of the way of the luggage which is being carried.

SCOTT.

Scott sidecar chassis are unique in being the only type in which complete triangulation is achieved, not only in themselves but in relation to the frame of the machines to which they are attached. Four points of attachment are incorporated in the motor cycle frame, and the two front ones are joined to the apex of the triangular chassis. The axle is straight, and of girder form. Springing is effected by coil springs in tension, working through a link system, and the body is further carried on two short compression springs. A neater body is now made, composed entirely of aluminium, handsomely enamelled in Scott purple, and having the locker at the rear enlarged sufficiently to admit petrol tins.



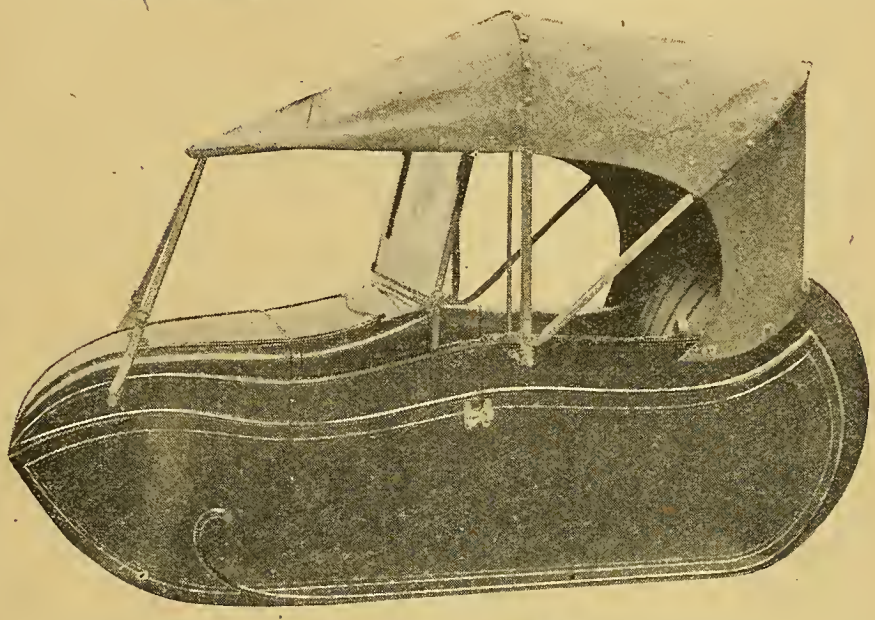
The Norton sidecar with dickey seat

HARLEY-DAVIDSON.

Some extremely luxurious sidecars were fitted to these powerful American machines, one especially being a splendid example of the coachmakers' art. It was equipped with a disappearing hood, which, when out of use, is concealed beneath the uppermost rolls of the upholstery. This body was replete with every possible refinement conducive to the passenger's comfort, and was one of the most elaborate on show.

INDIAN.

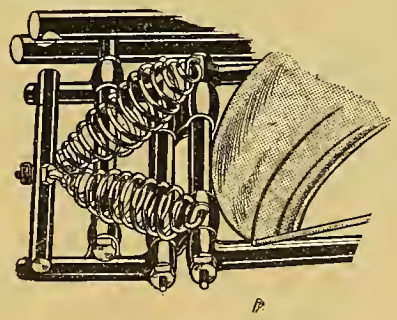
Indian motor cycles are fitted with extremely neat sidecars, the smaller Scout model being attached to a chassis with a straight axle of the Millford type.



The Zenith sidecar body with folding dash.

The top front connection clamps both tubes of the motor cycle duplex frame, while the lower one reaches from the engine lug almost to the extreme outer end of the chassis front cross-member.

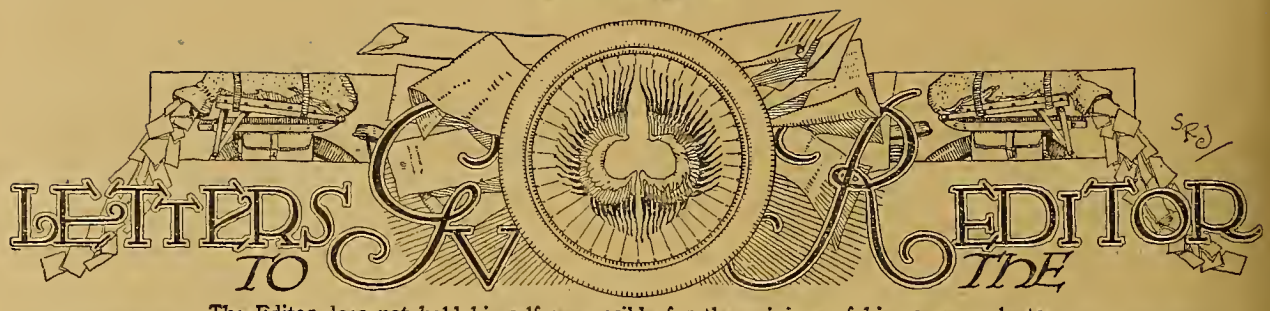
This feature is also noticeable in the heavy model, which has special connections to suit the spring frame of the Powerplus machine. A commodious body is fitted on this sidecar, and a large compartment for spares is provided in the rounded rear portion. The upholstery is exceptionally deep and the back is high, which should make for easy riding, a point to be appreciated on long journeys.



Coil springs are used to suspend the Bamco wheel.

CLYNO.

In plan view the Clyno chassis is a truncated triangle, and it is attached to the spring frame of the motor cycle by four connections, which are only capable of slight adjustment. The wheel is carried in a fork hinged at the front, and controlled by a laminated quarter-elliptic spring. Luxury is the keynote of the body, which is provided with every convenience for the carriage of spare wheel, luggage, and petrol. It is equipped with hood and screen.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

MOTOR CYCLING IN INDIA.

Sir,—I am contemplating taking an appointment in India (Plantong), and understand that a motor cycle is a necessity.

Now, I have a 2½ h.p. two-stroke Metro-Tyler, which has given me every satisfaction, and I am wondering if this would stand up to the work required in India, or whether I should do better to invest in a higher-powered mount in England and take it with me, or whether it would be better to purchase a machine on arrival.

If any of your readers could help me in this matter, I should be obliged. TWO-STROKE.

Bristol.

SCOUTS AND ROAD GUIDES.

Sir,—I read with the greatest pleasure what the A.A. scouts have been doing in all parts of the kingdom. My father, who has been using his motor cycle for the last eight or ten months in travelling about Cornwall, joined the A.C.U. in April or May last, thinking that their scouts might be useful to help him. Much to his surprise, he has not seen a single A.C.U. scout up to this day. A.A. scouts are frequently met at St. Austell, Truro, Camborne, and Penzance. Once they had the courtesy to help my father, who then definitely decided to substitute his present badge for an A.A. one.

Surely the motor cyclists of the south-western districts are entitled to the benefits of the Union as much as other districts, or is it that other districts are suffering as we are? I should like the A.C.U. to give me an answer. J.H.B.

THE LIGHTING REGULATIONS.

Sir,—As a humble push cyclist, I should like to support strongly your remarks with regard to the rear lighting of push cycles on the road.

As "Sommon Cense" remarked in your columns recently, the purpose of rear lights on any vehicle is to give due warning to other vehicles approaching from behind. If there are three vehicles on the road, A, B, and C, with respective speeds of 30, 20, and 10 m.p.h., it stands to reason that if any one of them is to be exempted from carrying a rear light that one should be vehicle A, the fastest, because it is not overtaken by anyone else. Of course, in practice, a rear light is necessary on all, if only for stoppages, but the same principle applies, viz., that the slowest vehicle on the road should be the most careful to carry rear lights.

It is foolish for "Sivel" and others to be "forced to the conclusion" that the desire for rear-lighting "is the outcome of the unfortunate craze for speed among the more reckless members of our fraternity." Such an argument can only be advanced by those who are unaware how invisible a cyclist usually is from behind at night, especially if the road surface happens to be dark (unless, of course, he has the consideration to carry a rear light). When riding quite slowly at night on a push bicycle with a good front lamp I have often had considerable difficulty in avoiding lampless cyclists in front, who, until within a very short distance, are well-nigh indistinguishable.

Personally, my opinion is that cyclists' objection to carrying a rear light is rooted in mere laziness, the feeling of "I cannot be bothered to mess about with another lamp." I have discussed this matter with many cyclists, and they all agree that, both in order to ensure safety and from a regard for the feelings of other users of the road, a rear light should be carried. TOLERATION.

Clifton.

Sir,—Will you kindly allow me space in which to reply to the letters appearing in *The Motor Cycle* of November 20th referring to my communication published in a recent issue?

It is evident that no result profitable for anybody can ensue from any discussion with a man who treats the subject as does "Iorwarth." His deliberate misquotations from my letter, and imputations of lack of sense on the part of all cyclists, coupled with generally cheap rhetoric, do not "cut any ice" in this matter. It is a poor cause that necessitates such bolstering.

I deny emphatically the statement of "M 5229" that "there can be no doubt of the advantages of the rear lamp." Its notorious unreliability, both as regards its keeping alight and it value as a preventive of accidents, is surely too well known to anyone who reads the daily papers regularly to need comment.

"Sommon Cense" treats the matter much more reasonably. But the whole kernel of the matter is that the enthusiasts of the rear light start from an erroneous basis. I hold the unalterable view that the onus of avoiding accidents should lie with the overtaking vehicle. It does not matter whether the "obstacle" is a cyclist, pedestrian, vehicle, child, or anything else, and if I had the ordering of things, rear lights on *all* vehicles should be done away with. What, in the name of sense, do we carry a head light for? Surely to show us what is in front, and, for our own skins' sake, if for nobody else's, to avoid running into it! I repeat that no one has any right to be travelling at night at such a speed that he is unable to discern any other traffic in time to avoid it. Instances are common enough of cyclists being run into in spite of their rear lamps.

There are probably road hogs amongst cyclists, as there are amongst motorists (I hold no brief for either in this matter), but, amongst cyclists, can "Iorwarth" match me the incident that has occurred since my last letter was published, where, in a West-end street, a doctor was knocked down by the driver of a car, and (for all the driver cared to the contrary) left to die there? SIVEL.

London, N.

SCOOTERS.

Sir,—I have read one or two letters in *The Motor Cycle* on the future of the scooter, and as I believe I have probably had more experience of these machines than anyone in Great Britain, I am venturing to air my views on the subject. I cannot yet decide whether or not they will survive. As at present constructed they fall between two stools. To the experienced motor cyclist they provide a cold, undignified, and altogether miserable mode of progression. On the other hand, the complete novice will have such difficulty in starting them and keeping them in working order that he is likely very early to abandon them as hopeless. I can assure those who favour a seat on scooters that they had better abandon the idea right away. A scooter with 10in. wheels is rideable on quite bad roads standing and no inconvenience is felt from vibration. The scooter does not skid except under extreme provocation, and when it does so it is neither dangerous nor in the least alarming. On the other hand, "Speedman's wobble" (or wabble) on a scooter is a truly harrowing experience. As far as steering and balance are concerned, a scooter can be ridden by almost anyone at the first attempt. Yet, before it can become popular, there are one or two very thorny problems to be overcome. The most serious difficulty is to provide a small

engine of considerable efficiency which is easily pushed off from cold on a very low gear. The propulsive power of the average girl hopping along on one leg is lamentably small. She is also utterly unable to carry 100 lb. up the front steps. She does not know when the mixture is too rich or too thin, and takes a very long time to learn; much longer than she takes to get utterly fed up with scooters.

Such refinements as automatic inlet valves and drip feed carburetters helped to brighten the life of our old friend Herr Gottlieb Daimler. But they became obsolete on road vehicles. They enjoyed a fresh lease of life when the internal combustion engine was first applied to aeroplanes, and again when it was applied to farm tractors. In every case they blossomed and died, and there is no very obvious reason for going all over these ghastly experiments again in the case of the scooter. It is otherwise with the flywheel magneto, which is simple and understandable, and provides a useful low-tension current for the lamps.

I am quite sure it is neither necessary nor desirable for a scooter to be capable of a greater speed than 15 to 20 m.p.h., nor to be able to climb anything more trying than an ordinary main road hill of 1 in 12 to 1 in 10. It grieves me to read that the A.C.U. proposes to take a hand in scooter design. From an engineering point of view, I sympathise with what I imagine is their ideal scooter, namely, four cylinders, water-cooled, three-speed and reverse, electric light and self-starter, etc., etc., but it is not the slightest use to my Aunt Jane. It is she who in her thousands is going to design the ultimate scooter.

In conclusion it is well to remember that the tractive resistance of a scooter is much greater, wind resistance at least equal, and weight not much less than in the case of a motor cycle. Consequently, any old engine will *not* do.

J. KENNEDY (Maj., R.G.A.).

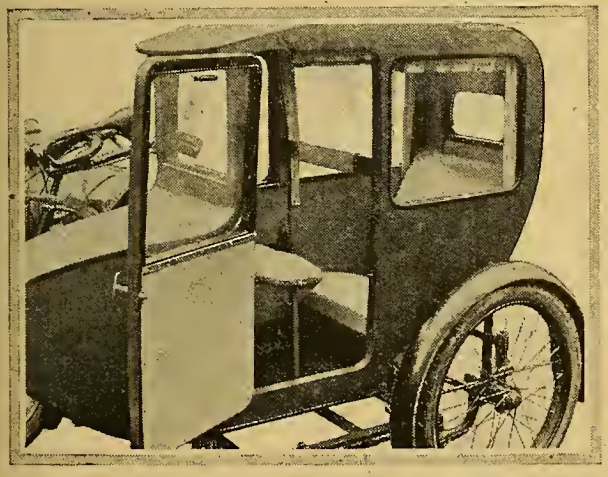
A.C.U. SIX DAYS TRIALS.

Sir,—In looking over the results of the 1919 A.C.U. Six Days Trials, I was rather surprised to see that one or two machines of some of the well-known makes retired during the trial, whilst the remaining machines of the same make obtained gold medals. In the entry, for instance, of two machines of the X.Y.Z. make, one obtained a gold medal and the other retired, so that the average value of the performance could not be considered as very high. The reasons for failure I am not going into now. They are very interesting, and are, in many cases, particularly if due to tyre trouble or baulking, quite unavoidable. To the average man (who is, I suppose, a sort of half brother to that mythical person the "man in the street") the average performance of the particular machine he uses or fancies may be of interest, and, consequently, I have roughed out the following list, and hope it will be of interest to your readers:

Make of machine.	No. of machines starting.	Average No. of marks.	Order of merit.
Class A.—250 c.c. Solo.			
Levis	1	175	1
James	1	162	2
Velocette	2	87	3
Class B.—350 c.c. Solo.			
Verus	1	165	1
Douglas	2	146	2
Class C.—500 c.c. Solo.			
Rover	3	177	1
Blackburne	2	170.5	2
James	1	170	3
Ariel	3	130.5	4
Sunbeam	9	150	5
P. and M.	3	121	6
A.B.C.	2	65	7
Class D.—750 c.c. Solo.			
Rover	1	189	1
A.J.S.	1	188	2
B.S.A.	5	180	3
Norton	2	170	4
Triumph	4	165	5
Scott	5	146	6
Zenith	4	133	7
Class E.—1,000 c.c. Solo.			
Ariel	1	178	1
Class G.—500 c.c. Sidecar.			
Ariel	1	152	1
B.S.A.	1	148	2
Class H.—750 c.c. Sidecar.			
Norton	1	169	1
G.L.	1	167	2
Douglas	1	155	3
A.J.S.	5	136	4
James	2	134.5	5
Triumph	2	133.5	6
B.S.A.	2	25.5	7
Class K.—1,000 c.c. Sidecar or Cycle Car.			
Harley-Davidson	1	182	1
Blackburne	1	178	2
Matchless	5	173	3
Enfield	4	172	4
Clyno	1	165	5
Indian	2	141.5	6
Morgan	5	105	7
Ariel	2	61	8
Class L.—Sidecar or Cycle Car exceeding 1,000 c.c.			
Morgan	2	80.5	1

In closing, I will point out that the marks were obtained by adding together the total marks awarded to each machine of the same make and class and dividing the sum by the number of machines of that same make and class that actually started, but not necessarily finished

STANLEY WELLS.



TWO LUXURIOUS SIDECARS.

(Left) A two-seated saloon body made by a Coventry enthusiast and fitted to a folding chassis.

(Right) A French *coupe* sidecar, designed for taxi service.

SPARE PARTS.

Sir,—While overhauling my Calthorpe-Jap lightweight I found it necessary to renew several parts. I wrote to the Calthorpe Motor Cycle Co., who quoted the price of the spares per return. I sent the money and received the spares in two days. When buying a new machine I shall not forget the firm who sent spares as quickly as possible. I have no interest at all in the Calthorpe Motor Cycle Co., but am quite satisfied with their goods. F. C. HOWLING.

BENZOLE.

Sir,—We were all very patriotic towards our country during the war. Now that the war is over, I think a lot of us are getting rather slack in this direction.

Benzole has been tested, and proved to be as good as petrol for fuel as regards motor cycles. Why, therefore, do we not use more benzole? Benzole is made in our own country, and its manufacture means increase in home industry and labour.

Now that we are on reconstruction, we should all do what we can to help this great work.

Anvers, Belgium. A BENZOLE USER.

AUTOMATIC CARBURETTERS.

Sir,—I was interested in "Ixion's" remarks on automatic carburetters in your issue of November 6th.

I notice he does not mention the Capac, which is entirely automatic (not even an air slide to twiddle), and the smoothness of the working of the Bowden control is a joy unknown to the owners of the two-lever type, who occasionally suffer broken wires even in these days.

As regards consumption, my 2¾ h.p. Coulson B used one gallon two gills of petrol on a 150-mile run, which compares favourably with other types, I think.

The Capac is standard on the Coulson B.

I should like to add that the Coulson Engineering Co. are an ideal firm to deal with, always a reply by return, and nothing too much trouble, and the machine they make is very near to perfection.

The usual disclaimer. L. HEMINGWAY.

THE JUDGES' REPORT, A.C.U. TRIALS.

Sir,—The judges of the A.C.U. Six Days Trial are to be congratulated upon their report, which is, in general, good and very interesting reading, and should be of undoubted value to that section of the trade who are not too wise to learn.

I was, nevertheless, disappointed to read that section devoted to engines, where it said: "The judges regret to see so few examples of the larger multi-cylinder engines, both four and two-strokes. They consider also that attention might usefully be directed to water-cooled multi-cylinder two-strokes for sidecar use where cleanliness, together with the absence of uneven torque, noise, smell, and dirt, is of maximum importance."

In spite of the qualification, and without in any way depreciating the excellence of the Scott—which is deservedly mentioned—I am sorry to see the recommendation, and it surprises me that a quintet with the experience of the A.C.U. judges should advise water-cooling for the motor cycle. The opinion of such authorities cannot be lightly set aside, but, even so, I am among those who are not convinced that the recommendation is a good one, and who consider water-cooling unnecessary and therefore to be deprecated. We know a good air-cooled motor cycle engine will do all that is required of it (except possibly under extraordinary conditions); why then advise additional weight, cost, and complication, rather than improvement in the direction of efficient simplicity? Water-cooling is a concession to imperfect design or material, with the useful effect of largely equalising the temperature of cylinder walls; but there are other ways and means of doing this, and I am firmly of opinion that such means will, in the end, prevail, and water-cooled engines on vehicles (except for very special purposes) will become obsolete. Even to-day a water-cooled car cannot be said to be truly up-to-date, because of not fully utilising the fruits of modern research, and yet water-cooling with its costly weight and complication is recommended for a vehicle whose birthright should be low cost and simplicity.

The expression of regret to see so few large multi-cylinder engines also comes as a surprise. Personally, I would rather have seen it reported that the judges regretted to find it was considered necessary to fit large and heavy engines into a type of vehicle, *the very existence of which depends upon its comparative light weight and handiness.*

My comments are made in some little fear and trembling, but from an earnest desire that the greatest possible value should be obtained from the trial, and that the motor cycle should not suffer from the evil known as over-development, or development in the wrong direction.

JAS. L. NORTON.

WOMAN AND THE MOTOR CYCLE.

Sir,—It is not often I trouble your correspondence columns, but sometimes an onlooker sees most of the game, and I therefore ask leave to put before you some views and suggestions regarding the motor cycle.

First of all, I am such a lover of the solo motor bicycle, believing it to be of all forms of motoring the most genuinely sporting, that I feel compelled to ask whither is this pastime drifting?

We find to-day the motor bicycle becoming heavier and heavier, more powerful and yet more powerful, more car-like every day. It can never be a car; it must always remain a bicycle, but in this striving after what it never can be, I think it is losing its charm and individuality, and, consequently, losing many potential adherents. The reason is, of course, the sidecar, and if we seek further we find the real reason is what is contained in the sidecar, that is, "*la femme.*"

If motor cycling is going to become simply a method of transportation—draughty, uncomfortable, and a cheap imitation of a car—well and good, but it is not that way that the sport will be kept alive; the woman must become also a motor bicyclist; she must taste the joys of a light solo, and not be content to remain luggage.

The war taught us many things; one was that a woman was a biped (a great discovery this), and that when dressed in breeches she does not lose in any way her femininity (if this is in doubt, see Fay Compton as a motor cyclist in "Summer Time"); finally, that a girl can drive a motor cycle as well as a man.

The future of motor cycling depends, therefore, on her. Will she be persuaded to share the pleasures of the road as a co-equal with man, or is she content to freeze at his side?

Propaganda and education alone will evolve the motor cycling girl, and in your hands, Mr. Editor, lies the future. We do not want a lady's machine; it would be as logical to try and breed a drop-framed horse; if you can get her to like it, that is all that is required.

What should be done at present is to encourage women to enter competitions, reserving every time a class especially for them; also compelling all entries by firms for team trials of whatever kind to have one at least of their machines mounted by a woman.

I know that I have set you a heavy task; I know that the class that motor cycle are very conservative—in some ways very prudish—but their education lies in your hands. Should you succeed, much happiness will be given to many; many more bicycles will be sold. It is a task that is worthy of an endeavour, and your success in it is the earnest wish of J. T. C. MOORE-BRABAZON.

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Lubricating Valve Stems.

[?] On the 1911 twin Rex there is a pipe with a tap and union running from the crank case to the branch of the induction pipe. What is its purpose?—H.T.

The tube from the timing case to the induction pipe of the Rex engine was so placed in order that a certain amount of oil should flow from the crank case into the induction system in order to lubricate the inlet valve stems.

A Fluffy Exhaust.

[?] I have a 4 h.p. Bradbury, and on my last run the sound of the exhaust, which is usually very sharp and clear, all at once seemed to become hoarse, or muffled, and I had to keep the throttle well opened, which has never been necessary before. Loss of power and difficult starting, with large petrol consumption, and the exhaust muffled are the symptoms of the trouble. Could you kindly help?—H.T.

The probable cause of your engine trouble is that the exhaust valve has become burnt or stretched. Note whether there is any clearance between the end of the valve stem and the tappet. There should be about one-hundredth of an inch. If there is no clearance, or if the valve seating has become burnt, you will lose compression and find all the defective symptoms which you describe. A new valve will be required if it has stretched badly, but if only slight the stem may be filed short enough and the valve refaced.

The 2¾ h.p. F.N.

[?] (1.) Oil is splashing from the flywheel to the outside of the machine. Is it due to over-lubrication? (2.) When taking the engine out for cleaning purposes, I presume that I need not detach either the magneto or gear box, but only the shaft drive. Am I correct? (3.) Shaft drive. How is this connected and disconnected when I want to take out either the engine or back wheel? (4.) Could I get the fixed type Bosch magneto converted into an advance and retard type?—W.L.

The overhauling of the 2¾ h.p. F.N. was thoroughly dealt with in an article which appeared in *The Motor Cycle* of January 9th, 1919. (1.) The trouble of oil splashing from the flywheel is probably due to wear in the main shaft bearing. (2.) The engine unit can be removed complete with magneto, flywheel, etc. (3.) The connection between the transmission and the engine is merely a sliding one, and you can draw the engine forward clear of the front universal joint. To remove the rear wheel take out the axle bolt, when the wheel may be drawn out. The shaft drive does not require disconnecting in any other way. (4.) We cannot state whether the magneto can be converted as you suggest without examining it.

A Misrepresented Bargain.

[?] On September 18th an advertisement appeared in *The Motor Cycle* offering a 1918-1919 combination for sale. I journeyed over 200 miles to bring it down by road, but, on my arrival, I found the description entirely wrong, as it was a 1915 model, and in a shocking state. Do you think, under these circumstances I can sue the advertiser for damages? I consider it entirely wrong of him to allow one to do such a journey on a false errand. I should feel grateful if you could advise me.—L.E.B.

The point which you raise is novel and interesting. We presume the correspondence would clearly show that you were making the journey for the express purpose of inspecting the machine, the owner agreeing to this. If you had actually bought the machine you could have commenced an action against the seller on account of his misrepresentation, and would have succeeded, whether the seller made the representation innocently or fraudulently, because there would have been a breach of contract. In this case, however, there was no contract, and in order to succeed in an action you would have to show that the owner of the motor cycle made the representation fraudulently. In other words, you would have to show that the owner knew that the statement in the advertisement was false, or else that he made the statement with recklessness as to whether it was true or not. Of course, the owner might have made the misrepresentation quite innocently, as he may have bought it himself under a similar misrepresentation, and without discovering it was in fact a 1915 machine. In such a case he could not be held responsible for the inconvenience involved.

A SCENE IN THE O.K.-UNION INVERNESS-LAND'S END TRIAL.

The road from Birmingham to Bristol commences with about four miles of tramlines. Capt. Pike, accompanied by an observer, is here seen heading for Bristol on the afternoon of Friday, the 21st ult.

Carburetter Blow-back

Will you tell me the cause of petrol being thrown back through the carburetter? There have been no alterations to the valve timing or carburetter; in fact, the valves are on the makers' mark. The valves have been ground in, and there is the recognised clearance between the tappets and valve stems. Compression is good, and there are no air leaks about the induction pipes. I shall be greatly indebted if you can suggest a remedy.—J.M.S.

Blow-back through the carburetter is a common fault with many engines. As, however, you feel sure that the valve timing is correct, we can only suggest that it is caused either by a delayed closing of the valve or bouncing of the valve on its seating. Stronger inlet valve springs might cure the trouble. If not, try timing the valves to close a little earlier, say, an advancement of one tooth on the half time wheel.

Claim after Purchase.

Early this season I had a well-known motor cycle and sidecar offered me for £50; and, after a short trial run and being told that the machine was a 1912 and in thorough good order, I agreed to give £40 for it, giving a cheque for £20 on account. During the next few days, on further trial, the machine developed engine and gear trouble, and, on taking it to a garage, I was advised to have it put right, which cost about £7. On seeing the late owner, and explaining matters, he took off £5—I giving another cheque for £15, making £35, for the turnout. Ever since that time the cycle has been more or less a trouble, costing in repairs and extras another £7, and the last time I was at a garage I was there informed it was not a 1912, *but a 1910*. Now, I shall be very much obliged if you will tell me if I have any claim against the late owner, seeing I have spent this money on the machine, and had it several months.—B.A.C.L.

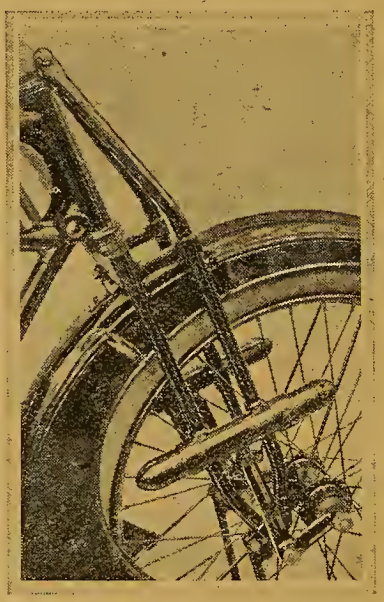
We do not think, under the circumstances, that you can make any further claim against the late owner of your motor cycle. As you obtained it at a considerable reduction in price in the first instance, we think that in the event of a legal action, the amount deducted would be taken as balancing the subsequent expenditure necessitated in putting the machine in good running order. Of course, if you can prove that the date was wilfully misrepresented, you have good grounds for demanding compensation, but these appear to be prejudiced by the fact that you have retained and used the machine so long.

READERS' REPLIES.

I notice a reader, "R.N.B.," requires to know of some preparation for blacking cylinders. I have used many of the various preparations sold for the purpose, and Rosco, made by Owen Bros., of Hull, is the best I have tried. Many of these are simply enamels, and are harmful to the cooling, but I have never found Rosco to affect the cooling in any way. Of course, you require to paint it on periodically.—R.S.

Norton Big Four.

In your issue of October 9th I noticed a query as to the wearing qualities of the Norton Big Four. If the enquirer cares to write me I can put him into communication with scores of private riders who can testify to the excellent wearing qualities of all Norton engines. Or I can show him in Sheffield two 1919 Big Four, Norton combinations which have both done over 5,000 miles, some of it in strenuous competition, and the engines of which have had not the slightest attention except for decarbonising. These engines are in perfect condition, and open to any examination. I recently met a man who had just purchased a Norton combination under the impression that he had bought a 1914 Big Four. (It was described as such on his receipt.) I pointed out to him that he had got a 1910 3½ h.p. But even then he expressed his complete satisfaction with the machine, and averred that the speed and power were a revelation to him. That machine was nine years old.—DAN BRADBURY.



A novelty in spring forks on the new Corona motor cycle; the action is obtained by the use of bell cranks and enclosed coil springs.

EXPERIENCES WANTED.

"R.S." (Oxford).—5 h.p. Zenith-Gradua-Jap, clutch model. Petrol consumption, starting, hill-climbing, gear, and belt drive, sidecar and solo.

RECOMMENDED ROUTES.

LINCOLN TO COLWYN BAY.—R.V.W.

Lincoln, Newark, Nottingham, Lenton, Derby, Mickleover, Uttoxeter, Stone, Eccleshall, Market Drayton, Whitchurch, Wrexham, Mold, St. Asaph, Abergele, Colwyn Bay.

SHEFFIELD TO ELY (CAMBS.).—E.B.

Sheffield, Worksop, Ollerton, Newark, Grantham, Stamford, Peterborough, Wisbech (straight on *via* King's Lynn for Hunstanton), turn right for Ely.

SPARKLETS

Change of Address.

The makers of Velocette motor cycles have removed to larger works, the new address being Veloce, Ltd., Victoria Road, Six Ways, Aston Manor, Birmingham.

Vacuum Oils in France.

Motor cyclists who have occasion to visit France, and who propose taking their motor cycles with them, will be glad to learn that Vacuum Mobiloils in all the well-known grades are readily obtainable throughout that country.

Merrall Brown Three-wheelers.

Owing to confusion with similar names in the motor industry, the Premier Motor Engineering Co., of Bolton, Lancs., who manufacture the Merrall Brown three-wheeled runabout, will in future be known as Merrall Brown Motors, the address being St. George's Road Works, Bolton.

Royal Ruby Prices.

Owing to the increased cost of material and labour, the Ruby Cycle Co., Ltd. regret that an advance in prices is unavoidable. The nett figures now stand at £48 for the single geared two-stroke and £155 for the 8 h.p. sidecar outfit, the cost of the motor cycle and sidecar being £122 and £33 respectively.

Anglo-Mexican Staff Lectures.

Professor C. R. Darling, A.R.C.S., F.I.C., gave an interesting lecture on "Heat" to the staff of the Anglo-Mexican Petroleum Company, at 16 Finsbury Circus, on Wednesday last. The lecture, which was the first of a series to be given during the winter months, was illustrated by sundry experiments and was greatly appreciated.

C.A.V. Magnetos.

We have received a folder describing the new KU1 and KU2 C.A.V. magnetos, issued by Messrs. C. A. Vandervell and Company, Ltd., Warple Way, Acton Vale, London, W.3.

Of these, the KU1 is a lightweight magneto for single-cylinder motor cycles up to 3 h.p., while the KU2 is a twin-cylinder model for engines rated up to 3 h.p. firing at 180°.

1919 Speed Trials.

In reviewing the results of the past season's speed events, it is interesting to observe that the thirty-three competitors who secured "firsts" in the Essex Motor Club Open Speed Trials, the fourteen "firsts" in the Weston-super-Mare Speed Trials, the fourteen "firsts" in the Luton Speed Trials, and the six "firsts" in the Scottish Speed Trials, all pinned their faith to Wakefield Castrol, in addition to which all the competitors who finished in the Scott Trial used the same oil.

DECEMBER 11TH, 1919.

Motor Cycle Taxation.

WE cannot but congratulate the Auto-Cycle Union on its attitude towards the question of motor taxation which is bound to come up in the near future. The A.C.U. has not gone on the lines "we want to be taxed," but it has realised that an alteration in the present taxation of motor vehicles is inevitable, and it therefore has approached the authorities with a reasonable suggestion, putting forth proposals which, if adopted, will bring in a useful source of revenue and will, at the same time, be fair to all users of motor cycles.

The suggestion is that the taxation of motor spirit is the most practical method of spreading the burden fairly over the whole motoring community, and that there should be a flat rate of 4d. a gallon import duty on all imported motor spirit used by mechanical road vehicles of every description. This scheme covers everyone alike; commercial vehicles, touring cars, and motor cycles of all kinds and used for all purposes. Everyone, therefore, bears an equal share, and no one has preferential treatment. The A.C.U. also thinks that if, in addition to the tax based on the use made of a motor vehicle, an annual charge on motor cycles is also to be levied, this should take the form of a wheel tax on all road vehicles, say, 2s. 6d. per wheel, such tax being a fee or licence to use the road for one year from the date of payment, and this, again, is a very reasonable suggestion. It means that, in addition to the petrol tax, the motor bicycle owner would have to pay 5s., the three-wheeler owner (including sidecars and three-wheeled cycle cars) 7s. 6d., and the four-wheeled cycle car owner 10s.

An important point is that the road tax, in other words, what is now known as the local taxation licence, would, if the scheme be adopted, be available for one year from the date of payment. Under the existing conditions the local taxation licence expires on December 31st, irrespective of the date on which the user takes out the licence. This means that since the only rebate is 10s. from October 1st, a motor cyclist may only get six months' use of his machine and yet have to pay the full fee.

Tourist Trophy Events in 1920.

IN our last issue we outlined the present position with regard to the T.T. Races in 1920. Whereas the original proposal was that the 500 c.c. event should be dropped next year (largely on the score of the risks attendant upon the rider, and to the increased efficiency and, consequently, added speed of modern machines), manufacturers who take an interest in racing feel that to abandon the classic 500 c.c. event would be wrong policy. As a result, the question is being reconsidered, and there is a distinct probability, if we are able accurately to judge the feelings of the trade by our conversations with them, that the 1920 Isle of Man programme will include a 500 c.c. event on one day, in addition to races for 350 c.c. and 250 c.c. machines run concurrently on another day. The fastest machine in this latter event will probably be awarded the Junior T.T., and the winning 250 c.c. machine the trophy offered by *The Motor Cycle* some months ago to encourage lightweight development. Weight limits, as already recorded, may be abandoned, and we regret this course from many points of view, particularly in the case of the smallest machines. The average solo rider wants a light machine, and he regards the weight factor as being more important than engine size, provided always that the engine is up to its work. As engine efficiency is increased, the usual course is to strengthen the frame and so increase its weight. Instead, the lightweight idea should be retained and the engine gradually cut down in size to suit the light frame.

We fear that many critics are drawing upon ancient experiences with lightweights when discussing the question of weight limits.

An index to the advertisements in this issue will be found on the page facing the back cover.

OCCASIONAL COMMENTS

BY 'IXION'

Slow Work!

I DO not know whether it took longer to get round the Cycle Show or the Car Show. At the latter one was jammed in an impenetrable, slow-moving mob. At the former the gangways were comparatively clear, and encounters with old friends were continuous —few of them seen for years owing to the war. On top of that the exhibits demanded far more attention than authorities had predicted. It was common talk that there would be few real novelties staged, whilst the revolutionary designs had been published long enough ago for us all to have realised them and discussed them. But when we got in front of the actual machines, whether they were sedately conventional or audacious to the verge of the *bizarre*, we began to fall out with our best friends as argument waxed warm.

Flat Twins, for Example.

FOR instance, the flat twin has long ago ceased to be a novelty. Jones, just home from Russia, waxed enthusiastic about the Raleigh. Three of us, who had then spent four days in Olympia, prepared to be bored. But inside ten minutes we were cawing like a rook's parliament. Somebody said something about housing such engines in a motor cycle frame. We went to see the Brough, with its lonely front cylinder sticking out all by itself in front of the down tube. Then we adjourned to show Jones the transverse mounting of the A.B.C., and from that we wandered on to marvel at the Harley-Davidson ideas on the subject. By this time we had veered into a discussion on flat twin induction pipes, and the pilgrimage oscillated in the reverse direction, and was extended to include every flat twin in the Show—not forgetting the quaint Black Prince. Bored? Not a bit of it. When once the notions of different designers begin to soak in, a week is far too short, even when—as the *blasé* expert callously pretends—"there is really nothing new"!

Should be Standard.

THERE is a pleasing strain of innocency in my make-up, and, as I grow older, my cerebellum revs. rather feebly. So I stood for a long time with goggling eyes fixed on the enormous brake belt rim of the Dunelt front wheel. Still, many humiliating memories have rendered me cautious. I did *not* say to the designer, "You are a fool to fit such a powerful brake to a front wheel. Halve its diameter, or fit two shoes to the rear wheel rim, as the Cedos folk rather wisely do." Not me. I put on my best plough-boy expression (Monsieur Dunelt does not know me from Adam), and said meekly, "Please, sir, why is your front brake rim larger than any other in the Show"? He accomplished a lightning feat of legerdemain, and, hey presto! he had swopped the front and back wheels round! Not a bad idea, is it? For one thing, it is much nicer to sit on a low wall and cuddle the front wheel in your lap when it punctures than to lie on your tummy in the road. For another, when the canvas of the rear tyre begins to show through the tread, you do not have to dismount both covers—you merely change the wheels round. Wonder nobody has deliberately applied this to solo machines before.

A Promising Absentee.

HALF by accident, I stumbled on one of the "cleanest" engines I have ever seen, which ought to have been inside the Show instead of in a window in Hammersmith Road. The Metric is turned out in eight sizes—four singles and four twins—by a little *coterie* including Brewster, the ex-Norton expert, and Bacher, who has had a big finger in sundry J.A.P. engines. It is not a hybrid between those two famous power units, though it evinces the cleanliness of both: for it has been heavily crossed with aero engines in the second generation. Overhead valves, with pump lubrication; two exhausts per cylinder and one inlet; cylinders with detachable aluminium combustion heads; ball bearing crankshaft; and roller bearing big ends (rollers *and* races by Hoffmann). It is a super-modern hot-stuff engine, and we shall hear a lot more of it. Mr. Blackburne was in charge. I am not going to tell you the names of all the motor cycle magnates who have been sniffing at it, but he told me he had booked orders for 23,000!

Combined Cylinder and Crank Case.

IN the car world it is quite common to find cylinders cast in one with the top half of the crank case; but I fancy the Black Prince is the first motor cycle engine constructed on these lines, and it is certainly something of a feat to produce the entire "body" of a 4 h.p. flat twin out of two castings. Little brain waves of this type suggest how it may be possible to cheapen the motor cycle without making it nasty. If similar simplification were applied to every detail of a machine, we should see the long-awaited "Ford" pattern two-wheeler arrive.

Cheap Sidecar Combinations.

I PUT in the centre word lest the ungodly should guffaw. It was commonly stated before the Show that a decent sidecar combination was going to cost at least £200 a time in 1920. Some of our experts have darkly hinted that four-wheeled cars would put the breeze up sidecars by underselling them. Of course, one expects to pay £200 and a bit for such an outfit as the Bat limousine, with cut-glass chrysanthemum holders. But, even now, Olympia contains combinations which have no kinship with mangles and sell at far less than £200. Perhaps the most astonishing example is the 7 h.p. four-cylinder F.N., at £175—including 33⅓% import duty! I hear the Huns left the jigs intact at Liège, and stacks of *bijou* Bosch magnetos, which were too small to suit any military purpose. Or again, the Scott combination

Occasional Comments.—

at 140 guineas is quite of the *de luxe* class, if it is not high-powered for its job. The four-wheeled cycle car has a long furrow to hoe before it competes with such bargains as the above, both of which are as smooth running as anything money can buy.

The New Precision.

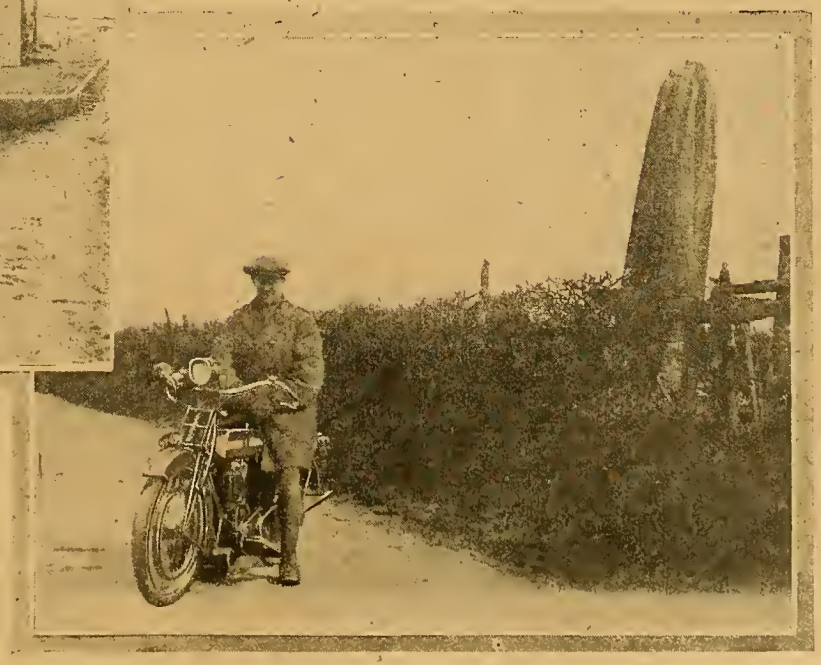
MACHINES like the new Precision are sure of a particularly warm welcome. During the war both design and production made great advances in allied branches of engineering. We expected a big infusion of new wine when peace returned. We have not had it. Our disappointment is explicable enough. There was an immense shortage of machines. The obvious thing was to go ahead and make that which was easiest to make, and which was known to be good. But we do not want to see the whole industry bogged in the old rut. Every few years some revolutionary machine—a Douglas or a Scott—astounds the industry, and proves that our previous best is not better than some previously unthought-of alternative, and, indeed, may not be quite so good for sundry special purposes. We all hoped that the aftermath of the war would include perhaps a dozen revolutionary machines, appealing to users beset by special requirements, offering a fresh sensation to the palates of jaded veterans, stimulating conventional designers to improve the weaker points of old designs, and so on. The A.B.C.—as yet largely untried—was the first of the expected débutantes. The new Precision is the second.

A Quadruple Slogan.

A GLANCE at the specification of the new Precision suggests that cheapness, light weight, comfort, and simplicity are its four inspirations. When production is in full swing, and we have all tried the newcomer for ourselves, we shall be able to estimate how far it goes towards success. Personally, I am sure its sponsors may be congratulated. A famous preacher once said that the chief secret of the pulpit consisted in knowing what to leave out. The Precision designer must have been tempted to insert a lot of items which are not essentials. Previously light, cheap machines have often been spoilt by uncomfortable frames, bad gear boxes, ill-balanced engines, shortage of power, and flimsiness of detail. The Precision seems to have steered a happy mean, disregarding nothing which is vital, and incorporating no weighty or expensive luxuries.

Still Room.

THUS two of the expected revolutionaries may be said to have made their bow—the A.B.C. as a mediumweight *de luxe*, the Precision as a mediumweight built down to the lowest weight and cost consistent with quality. A yawning gap remains. We are still waiting for the principal need to be supplied—the Ford motor cycle. The greatest demand of all is for a machine absolutely devoid of frills, selling at a rock-bottom price, and capable of 40,000 miles at economical maintenance costs. It need not be fast. It need not be any more comfortable than the average single-cylinder with a rigid frame (and that is not saying much). It cannot be conventional (or it will cost too much). It need not be beautiful (nobody ever loved a Ford for its looks). Simple, cheap, substantial, and a reliable goer—who will be the first to build it? It would be of incalculable political value, for it would ventilate Bolshevism out of the country, arrest the trek off the land, and, incidentally expand its producer into an international financier of the first water.



YORKSHIRE LANDMARKS.

(Left) The ruins of Middleham Castle, the home of the "King Maker," Earl of Warwick. (Right) The Devil's Arrow, an ancient stone on the roadside near Boroughbridge, supposed to have been placed there by the Romans.

The Year's Competitions.

A Brief Review of Post-war Reliability Trials.

Hill-climbs and Other Speed Trials of 1919.

ALTHOUGH the year has been a blank so far as records are concerned, owing to Brooklands being "closed for repairs," there have been numerous speed events to show that, had the track been available, some high speeds would have been recorded. The Luton Hoo, Weston-super-Mare, St. Andrews, and Southend flat events were revived, and the hill-climbs, at which some really remarkable speeds were obtained, included several events on Stile Cop and Sutton Bank. In the Stile Cop events, undoubtedly the star performances were those of the Sunbeams and Levis two-strokes in their respective classes; while the Indian, A.B.C., A.J.S., and Triumph figured conspicuously on Sutton Bank.

At the Luton Hoo speed trials, the outstanding achievements were those by H. Le Vack (3½ Edmund M.A.G.) and E. Baragwanath (8 Zenith); while at Weston Douglas machines shared the honours with Sunbeams, Harley-Davidsons, and Nortons. In the Scottish speed championships meeting at St. Andrews, the Douglas carried off the lightweight events, and a Triumph and an Indian scored in their respective classes.

Of all the speed trials, the Essex Club's speed event at Southend was the best attended, and the honours were so well distributed that it is difficult to recall any particularly outstanding performance, but single riders on a Zenith, Douglas, and Matchless, each won three events.

The Trials.

Reliability trials have been organised in greater numbers, and, apart from the two Six Days events, the most important have been held by the Midland clubs. The first big trial of the year, and one which created a great deal of interest, was the Victory Cup event organised by the Birmingham M.C.C. The trophy was carried off by G. Kuhn on a Levis in competition with seventy-seven machines of all types. There were so many equally good performances that the premier award was made on a speed-judging test, and in consequence brought forth a storm of protest against the inclusion of "speed-guessing" in trials which are organised primarily to prove the efficiency of motor cycles. As a result of this, most subsequent open trials eliminated split second timing for the purpose of finding a winner, a notable example being the one-day two hundred miles trial organised by the Midland Cycle and Athletic Club, in which were incorporated a number of tests including Alt-y-Bady Hill in Wales, a gradient on which very few of the sidecar machines succeeded in making a clean ascent. The premier award was won by H. B. Denley on an 8 h.p. four-speed Morgan; while out of an entry of seventy only three sidecar competitors secured gold medals. These were F. W. Giles (6 A.J.S.), J. Stevens (6 A.J.S.), and L. Newey (4¼ Ariel); while the gold medal soloists were L. L. Sealey (4¼ B.S.A.), G. A. Strange (5-6 James), and H. J. Stretton Ward (4 Triumph).

Contests of Increasing Severity.

Of the several one-day events, the M.C.C. team trial for *The Motor Cycle* Cup, the Scott sporting trial, and the Liverpool Club's event in Wales, were among the most important. The former attracted an entry of fifteen teams, and resulted in a win for the Coventry Club. The Scott event was an arduous trial over moorland tracks and through many watersplashes. Geoffrey Hill, who won the event on a 4 h.p. Triumph, averaged 22 m.p.h. over a course which the organisers considered a most difficult one at a 17 m.p.h. schedule.

This trial is unique in being one of the few specially organised to include the most arduous conditions possible, and it is of immense value as a test of machines produced to withstand overseas conditions.

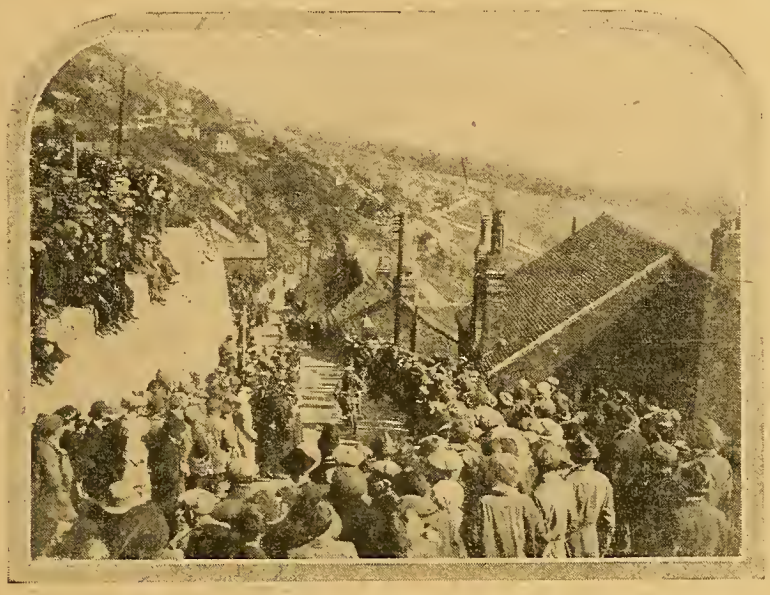
The Liverpool Club's Autumn Trial for the Reliance Cup was a hard day's gruelling over greasy mountain lanes and through watersplashes which heavy rains had turned into deep and swift torrents. The premier award was won by E. L. Boston (3½ Sunbeam).

Although not exactly in the same category as a trial, the London-Edinburgh Run at Whitsuntide should be included in the year's competitions. The single journey only was made this year, and no fewer than

The Year's Competitions.—

142 members competed, of which 125 completed the run. It was a most successful event and will long be remembered as the first big reunion of competition riders after four years of war.

The Arbuthnot Trophy Trial, although exclusive, bids fair to be one of the annual classic motor cycle events of the future. As its title suggests, the competition is for a perpetual trophy put up for competition among naval officers by the A.C.U., the trophy being a statuette of the late Rear-Admiral Sir R. K. Arbuthnot, Bart., and the event was inaugurated as a memorial of his gallant death at the Jutland battle. The honour of being the first holder of the trophy fell to Lt. E. S. K. Evans-Greaves, R.N. (4 Triumph).



Showing the great public interest shown in motor cycle trials. The photograph was taken on the Old Wyche, Malvern, during the Victory Cup Trial last April.

As in the days before the war, the Scottish Six Days proved a popular and most sporting contest. There were seventy-two entrants, of which fifty started, most of the withdrawals being due to the trade organisation's delay in coming to a decision regarding the trials to be supported by them. Eleven competitors secured first-class awards, ten second-class, and three third-class. Retirements in the solo class represented 50% of the starters, while in the sidecar class the proportion was a little over 55%.

The 1919 A.C.U. Six Days Trial proved to be a strenuous and trying event of a nature which has characterised the big trials of the chief motor cycle organisation. As in previous "English" Six Days Trials, the sporting spirit was subservient to a more serious demeanour as befitted the importance of the event. 111 competitors started, of which 82 finished, 26 being awarded gold medals, 34 silver, 14 bronze, and 9 no awards. A B.S.A. team won the much coveted team prize, and perhaps the outstanding feature of the various performances was the consistent good showing of the two-stroke twin Scotts and, in fact, of all two-stroke machines. F. G. Edmond (4 Triumph sc.) was the only single-cylinder sidecar competitor to secure a gold medal, and two 3½ h.p. engined sidecars succeeded in obtaining silver medals.

The competitions of the year 1919 will be completed by the historic London to Exeter and back run and the Bristol-Land's End trial, both of which will be held on Boxing night.

Altogether, one may conclude that motor cycles have improved since 1914, and that the men who ride them are in every way the compeers of their fellow enthusiasts whose names figured in the prize lists of pre-war days.

Is the Ford Type of Motor Cycle Wanted?

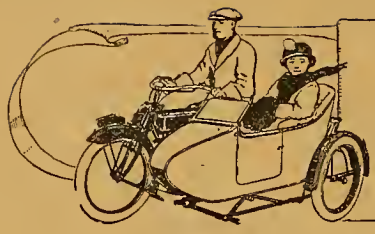
A GOOD many words and a great deal of ink have been wasted on the subject of the "Ford" or "quantity" production motor cycles to be marketed at a ridiculously low price in this country. These machines were to be produced in the United States according to some rumours, and again by newly capitalised companies in England. On the face of them, the various statements were absurd, and a writer in our American contemporary, *Motor Cycling and Bicycling*, airs views on the subject which are refreshing and candid. He says:

"The trouble is, what factory do you know of in the production end of motor cycling that would have the daring to risk a year's business to sound out the desires of the purchasing public? We blame the whole thing on the American idea, this seeming limit to the use of motor cycles. Too many citizens are eager to own a car, for that is a sign of affluence, no matter how old and decrepit it may look and sound. Haven't you had 'em ask you, 'Why don't you buy a car? I think it would be so much nicer than a motor cycle.' Sure you have, and they cannot grasp the idea of better quality and more fun you get when you possess a motor cycle.

"The Whozis, down the street, roll up in a new car. The neighbourhood is in an uproar of covetous gossip, and it swells their pride to be the subject of talk. This is lacking when the same family purchases a motor cycle. So you can count that one of the big factors against more folk riding motor cycles—an overweening desire to put on 'dog,' to say it bluntly.

"The motor cycle factories are ever eager to double their output, but they are cautious about making experiments that may prove too costly.

"It sounds good in print, this talk of all types and prices for motor cycles, but it doesn't work out well in fact. More than one dealer has a second-hand problem that has him worried. Probably not now, with the scarcity and high prices of new machines, but it was present a season or so ago. Try to convince a prospect that a 1912 single-cylinder outfit, lacking the refinements of later models, will be just as efficient transporting him to and from work as a 1919 electrically equipped three-speed, and use that lure of the difference it will make in the size of his bank roll. Then see him flop for the shiny new outfit, regardless of price. With a 'Ford' type of motor cycle selling for 'Ford' prices, you'd run up against the same snag, and your 'Ford' type machine would not be near so good a proposition as an old-timer of a few years back."



What the Ladies Think.

Comments on 1920 Machines by Two Well-known Lady Motor Cyclists.

WE live in an age of luxury, and modern motor cycles are well designed for ease and comfort. We have long asked for elegant sidecar outfits combined with more locker space, and many 1920 models have these good points. Prices have risen; but that we must expect and, given all our whims, we must not grumble on the score of expense, but rather readjust our minds to the change. Practically all the firms who market a motor cycle of 3½ h.p. and upwards list it as a passenger turnout. One of the gems of sidecar construction in the recent Show was attached to the big Harley-Davidson *de luxe* model. It was a wonderful piece of craftsmanship. By some contrivance the padded elbow rests of the sidecar could be turned back and the hood passed down out of the way and out of the reach of damage. The bulbous back concealed a locker, or could be used as a dickey seat for two children. There were no projections in any of the woodwork, all hinges and such things being buried out of sight. The finish of the bodywork in fawn enamel was superb.

Sidecar Comforts.

There are also other sidecars that provide additional seating accommodation in various ingenious ways. I know, personally, a family who take their jaunts with a tiny girl tucked down in the toe of the sidecar. This is not really comfortable, and no excuse can now be offered for this mode of travelling. The Canoelet has a new model which ought to be popular. It is most sporting in appearance, yet gives far more convenience than is usually found in such models. It gives three distinct seating positions, good locker room, and is well sprung. No door is provided, but a slight compromise exists in the form of a step. The finish is a bright colour with aluminium disc wheel. I overheard a middle-aged lady say that the sidecar seats were most of them too low. Adjustable seats are really necessary, as the older generation were taught in their youth to sit upright, and cannot forget their early training and recline in the manner of the youth of to-day. Some six years ago I designed a screen for my own motor cycle. The glass or celluloid was attached to a scuttle arrangement that hinged back to allow the door to be used. I found in this year's Show quite a number on exactly these lines. Evidently great minds still think alike! There are, however, many passenger machines that have no fripperies but give solid comfort. The Sunbeam, New Imperial, Enfield, Ariel, and P. and M. outfits are especially noticeable in this respect, and sell at a reasonable figure.

Runabouts bid fair to compete with the more expensive machines. The well-known Morgan three-wheeler costs less to-day than several of the *de luxe* sidecars, and, if only delivery were more easily obtainable, would be preferred by many who require car comfort and cleanliness in the bad weather. The Premier runabout is a promising newcomer with a pleasing layout. The Castle-Three would also appeal to the lady owner, and one could not go far wrong in selecting any of these in 1920.

Scooters.

To digress, we must have suitable clothes for winter riding, and the Dunhills stand in the corner of the Gallery came in for a good deal of attention. Riding coats and other motoring apparel were displayed, combining protection with good taste, so that there is small excuse nowadays for the woman who is not clad suitably for hard weather riding.

I must not overlook the scooters. So many people are interested in these that it was a difficult matter to get near. The Whippet deserved to be a favourite. The weight was well distributed, neither too far forward nor too far back for good design. The Quadrant autocyclette was another that was particularly neat, and may take the place of a lady's open-framed model motor cycle. These little mounts will bring many women into the motor cycling world. There is room for them all, and if Olympia becomes overcrowded and confined, on the broad highway will be found space enough.

MAY WALKER.

MANY MODELS REVIEWED.

THE first thing to attract my attention on entering Olympia was the spring frame Royal Ruby, and I was delighted with it, as I was later with the other frame springing systems, which I soon learned were becoming universal.

This was a good beginning to the day's enjoyment, and I passed on to the next item, and found a much altered old friend fitted with a Sturmey gear and an automatic Amac: to wit, the Connaught two-stroke, which seems an ideal lady's machine. Everywhere my eager eyes turned they seemed to find the spirit of dear old 1913-14, together with the advancement of 1919.

Take it from me, some of the two-stroke people have not been asleep! The new Scott is something which should be examined by every lady, for the whole affair is simply lovely, and it should appeal to all who desire a machine that is clean to ride and on which no special protection for the feet is necessary.

Among the "sporting 'bus" element, I saw several "first-raters," and one of the nicest was the Diamond four-stroke, for the riding position was about the best that I have ever experienced, and the speed

capabilities of this bicycle need not be enlarged upon. Another, this time a two-stroke, was the new Dunelt 500 c.c. model, which I should like very much to try for its power on hills, as its engine should pull better at low speeds than a 500 c.c. four-stroke.

But there are many from which to choose, and, as ladies nowadays will ride anything on two wheels, it becomes difficult to class any particular machines as "ladies' mounts."

Three American exhibitors who are running for star places for our next season's riding are the Indian, Harley, and Reading-Standard.

The new Indian Scout is quite in a place by itself, and if I had been born in Australia I should call it "Dinkum," for it was simply gorgeous. My favourite, the high-powered Reading-Standard, was also shown off to advantage.

Among flat twins the Harley-Davidson is certainly a winner, for it has a medium-sized engine, automatic carburetter, and all the refinements which the V twin possesses coupled with several new features, such as the absence of the noisy high-speed front chain.

Of course, the Precision motor cycle is about the only thing which is entirely brand new in every detail. It even has a countershaft brake, not to mention the audacious design of springing, and the compact tool box. If Henry Ford had designed this 'bus, he could hardly have made a better production job.

I met some old friends on the Zenith stand, and, after Mr. Sumner had tried to make us purchase the entire stock of Zenith flat twins, I hopped over to see Mr. D. R. O'Donovan about something serious, for, horrors! I could see a T.T. Norton with what appeared to be an N.S.U. gear attached, and I was rolling up my sleeves for a frontal attack when I discovered the gear to be the new Bradbury epicyclic, so "all clear" was sounded.

I am saying nothing about the rest of the Nortons, because it goes without saying that Mr. J. L. Norton makes everything worthy of his name.

By this time I had gathered a new host of impressions about the trend of things in general, and it must be said that everything is going ahead in a wonderful way for the future happiness of us *motocyclistes*.

In conclusion, I must mention the dear little A.B.C. flat twin, which is quite as unique as the Precision. Its really well thought out front leg guard system, incorporated with the frame duplex down tubes, appears to be just what one would desire.

MINNIE TULLY.

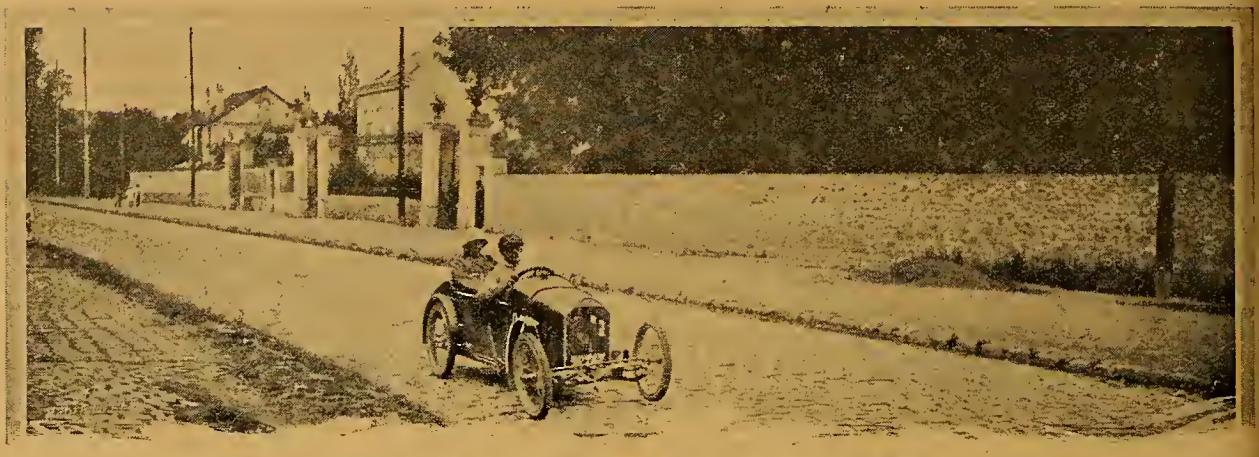
AT THE MEET. In these days of high cost, the comparative economy of the sidecar is appreciated, especially on purely pleasure runs.

THE PARIS-NICE TRIAL, FEBRUARY 13th-16th, 1920.

THE Paris-Nice Trial has always been an attraction to English motor cyclists. In 1913 *The Motor Cycle* organised a most successful party of some twenty riders, who took part in this event. They all enjoyed themselves thoroughly, the novelty of the competition and the beauties of the Riviera greatly appealing to them. In 1914 an English team also took part in the trial, while for next year the organisers, Le Moto Club de Nice, aided by *Motocyclisme* and *Le Petit Journal*, are endeavouring to improve upon the rules of previous years. Mr. G. Sweerts, editor of *Motocyclisme*, is endeavouring to get entries of teams of military despatch riders entered by the Governments of the various countries who will take part. He has already approached the French Minister of War, and, we believe, the British War Office. Provided the French Minister of War agrees with the idea, it is possible that Great Britain may send a team, as well as Belgium, Switzerland, and possibly Italy, while the Americans are also being approached. We hope to publish the rules shortly, and shall keep our readers well informed with the progress of the organisation of the event.

FORTHCOMING FRENCH EVENTS.

Strenuous and Interesting Competitions.



A French cycle car, the Noel, passing over typical French *pave* roads.

THE year 1920 will be a busy one in French motor cycle and cycle car circles. Not only will there be several big international races and competitions held by the national authority in France, but all the local clubs are showing signs of activity, and are preparing to request permission to hold races, hill-climbs, and touring competitions.

It is impossible, at the present moment, even to outline the full programme, for the clubs are just beginning to discuss their future events, and cannot definitely decide on them for several months to come.

The first big event of the year will be the Paris-Nice trial, which has been fixed for February 14, 15, 16, and 17. This promises to be well supported by both trade and amateur riders, and machines of many makes and nationalities will be represented. Already the Union Motocycliste of Brussels has selected its official team, which will consist of M. Taymans on an American Excelsior, Madame Taymans on a Triumph, M. Werder on a Harley-Davidson, M. Dandois on a James, and Lieut. Réquillé on an undesignated make of machine. It would be contrary to French custom to select a team so long in advance, but the Frenchmen will be there nevertheless. English riders may be counted on in substantial numbers, and altogether the early-spring trip to Nice should be full of interest.

Races.

The great reliability trial of the year will be held in the French Alps, radiating from Grenoble, during the middle of the summer. With such climbs as the Galibiers, the Lautaret, Col d'Allos, etc., from six to ten thousand feet above sea level, to say nothing of the run from Grenoble to Paris, the severity of the trials is undoubted. There is, moreover, further attraction in that they take the competitors through some of the finest scenery to be found in Europe, and they will introduce riders to wonders of nature unknown at home.

The great speed event of the year will be held in the neighbourhood of Le Mans, during either August or early September. The Automobile Club of the West of France intends to organise either a two or three day meeting. It is more than probable that there will be separate long distance races for motor cycles, for cycle cars, for voiturettes—by which is meant machines weighing not more than 10 cwt.—and also for three-litre cars. This will be a race pure and simple, over a very fast, level course, specially prepared, boarded off, and guarded by troops.

There is a proposal to hold another race in the hilly district around Lyons. This suggestion comes from the Lyons Club, which is one of the most vigorous of the many provincial clubs in France. The exact nature of the competition has not been decided, nor has the date been settled.

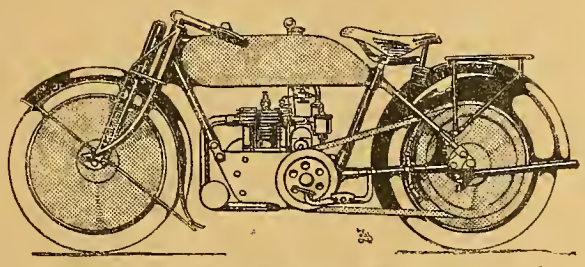
In the neighbourhood of Paris quite a number of races and competitions may be expected. Among them are the Circuit de l'Eure, Paris-Trouville, Paris-Deauville, Circuit de Paris, etc., all interesting in their way, but all more or less of a local nature.

Growing Activity.

It is rather curious that, while car manufacturers in France are not very enthusiastic about racing and competitions, the makers of motor cycles, on the other hand, are only too anxious to enter public trials. Probably this may be accounted for by the fact that there are immense possibilities ahead of the motor cycle, and its development will be favoured by the high prices prevailing for motor cars. The cheapest motor vehicle is now really expensive according to pre-war standards, and, as motor transportation must be secured, the motor cycle and the sidecar will be adopted. Before the war the great centre for motor cycle competitions and trials was England. It looks now as if France is to become a competitor.

This week the French postal authorities put into service for the Fifteenth District of Paris four motor cycles and sidecars for collecting letters from pillar boxes to the central office. Trials have already been made in another district of Paris, so that this move must not be looked upon in the nature of an experi-

Forthcoming French Events.



An example of French motor cycle design, the Bleriot 4 h.p. vertical twin. The two-speed gear box is combined with the crank case. Note the neat spring frame and disc wheels.

ment. The French postal authorities have been led to this action by reason of the increasing cost of labour. It is believed that one man with a motor cycle and sidecar will do as much work as three men afoot. Experiments have been made in Paris with electric vehicles, but these were not found satisfactory for the work required of them.

The French postal authorities also contemplate purchasing motor cycles for country postmen, and particularly for those in mountain regions. The French gendarmes have already been provided with motor cycles, and a number of these men are under training at the present time at the military motor park at Dourdon, where they are taught not only to ride but to care for their machines. In view of this statement, the visitor to Paris must not expect to see city police running up and down the boulevards on motor cycles. Gendarmes, who have been motor cyclarised—if the term may be permitted—are an entirely different body from the city police, with whom they are often confused by foreign visitors. The gendarme is half policeman, half soldier. He has authority on all the roads and in all the villages of France, but he is never found on duty in the streets of Paris.

A SIDECAR LANDAULET.

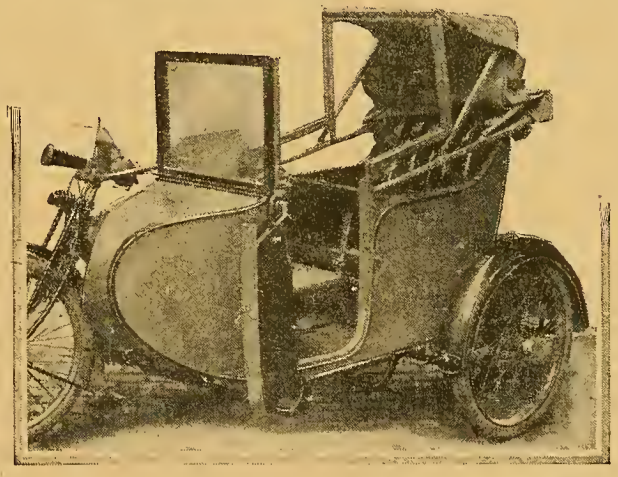
Complete Protection from the Weather. A Comfortable Double-seated Body.

THE idea of placing "taxi" sidecars on the road was mooted with a view to relieving traffic problems and providing a quick and inexpensive method of passenger transportation. Unfortunately those local authorities who were approached, for some unknown reason refused to issue hackney carriage licences for the swift and handy sidecar outfit, and in consequence the scheme has so far come to nothing, although we now hear of the possibility of its successful revival.

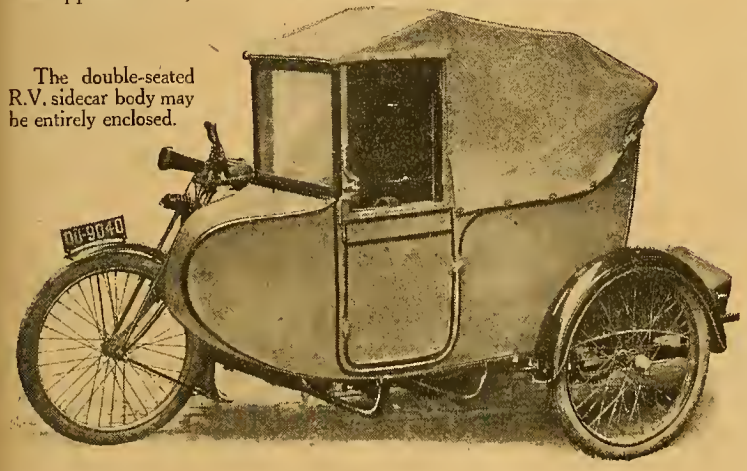
The Taxicab Body.

We have lately examined a most creditable piece of the sidecar bodybuilders' art, which was designed primarily for the above purpose, and regret that, owing to the official attitude, large quantities of these are not on the road fulfilling the duties for which they were intended. The body, shown in the accompanying illustrations, is fitted on a Gloria chassis attached to a Triumph motor cycle, and it is so little heavier than the standard coachbuilt body that the engine has suffered no noticeable distress in consequence of its use. Mr. H. S. Harvey, of the R.V. Sidecar Co., 92, Humber Avenue, Coventry, is responsible for the design and production of this body and its fittings. It will be noted that exceptional depth is given to the seat and sides of the sidecar, and that an additional folding seat is fitted, enabling two children to be comfortably accommodated in front of an adult passenger.

Sliding celluloid windows are fitted in the door and on the opposite side, while the windscreen is of the same material, and, when the hood is collapsed, may be tilted to any angle. A neat spring-operated locking device enables the slope of the screen to be permanently maintained without the use of the usual friction or serrated washers and wing nuts. Erection of the hood (which incorporates the frames for the side windows) is easily effected by one hand of the passenger, who can carry out the operation without moving out of the sidecar, and complete protection from the elements is assured.



Interior of the R.V. sidecar, showing extra seat and readily erected hood. The screen may be set and retained at any angle by means of a spring locking hinge.



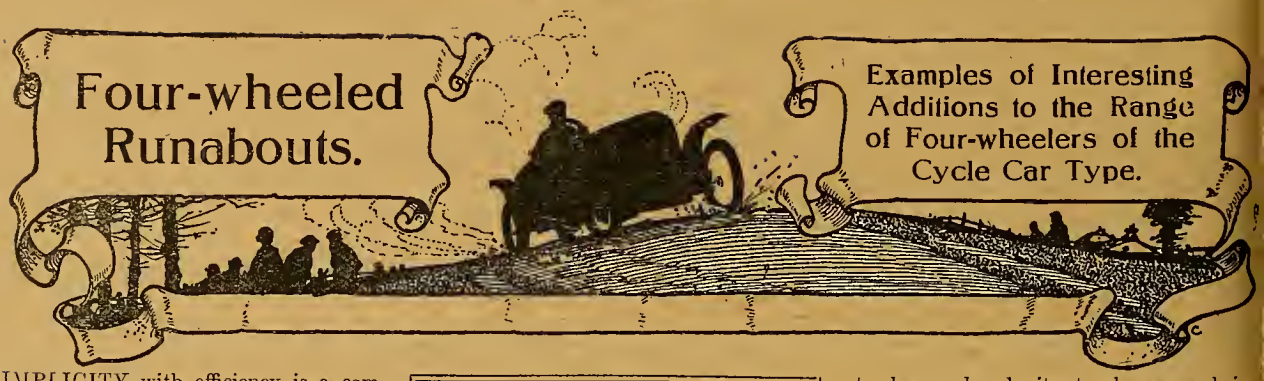
The double-seated R.V. sidecar body may be entirely enclosed.

Excellent Detail Work.

A large spring luggage platform is fitted to the rear of the chassis, which will accommodate a suit case and also has provision for the carrying of a spare petrol can.

The external finish of the bodywork is quite in keeping with the rest of the outfit, the general scheme being grey (to match the tank), with black mouldings and mahogany screen and window frames. The hood material is also of the same shade of grey. Well padded upholstery and comfortable seats are provided, and special care has been devoted to prevent ingress of water at the windscreen and hood joints.

Four-wheeled Runabouts.



Examples of Interesting Additions to the Range of Four-wheelers of the Cycle Car Type.

SIMPLICITY with efficiency is a combination hard to obtain in a runabout, if only for the reason that it has to equal the reliability of the motor cycle and be almost as silent as a car. It has been proved many times that a machine following motor cycle practice is not always a satisfactory commercial proposition, because the noise which is usually tolerated in the simpler type of vehicle is accentuated when the same kind of engine and transmission is enclosed.

By raising the back cushion of the Victor, access is obtained to a large locker. Incidentally, the construction of the body is shown in this illustration.

Notwithstanding the difficulties to be faced, however, there are still many fresh designers who are making big efforts to produce a comfortable four-wheeler which approximates to the motor cycle so far as the mechanical elements are concerned. Some of these machines are far superior to those of 1912, and these may become serious competitors to the motor cycle. On the other hand, there are others which reveal lack of appreciation of the causes of failure in previous designs. It is interesting, however, to watch the trend of design, and to record the advent of new designs and endeavours.

The Coventry Victor.

Recently we were able to take a trial run in a little four-wheeler fitted with the first of a new water-cooled engine produced by the Coventry Victor Motor Co., Ltd., who are making a 5-7 h.p. air-cooled opposed twin for motor cycles.

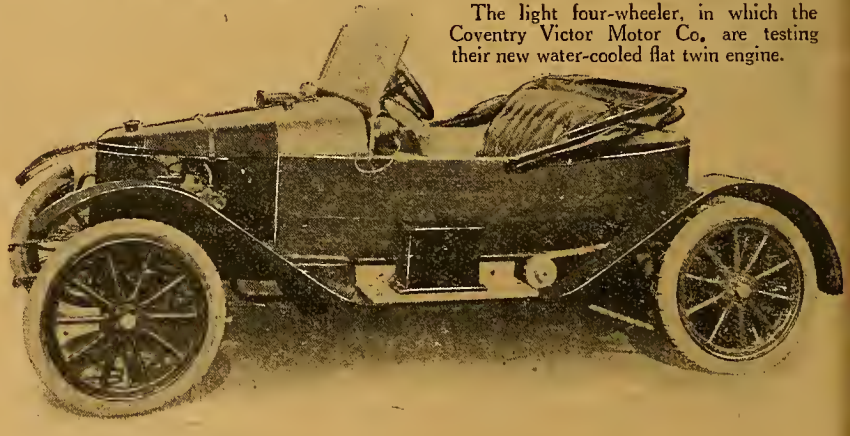
"Officially" there are no cycle cars. All three-wheelers are motor cycles, and any type of machine on four wheels is a motor car. Thus at the recent Olympia Shows there were anomalies to show the results of such a clear cut line of demarcation. It would appear that the number of wheels does not quite adequately mark the point where the motor cyclist's interests become those of the car owner, and whether a machine has three wheels or four, it cannot fail to interest a section of the motor cycling fraternity if motor cycle practice in engine and transmission is followed, and above all if the price is approximately the same as that of a motor cycle and sidecar. The small four-wheeled runabouts described and illustrated in the following pages are of this type of four-wheeled motor cycle.

The little car itself is extremely interesting if only for the system of construction, which is reminiscent of the canvas canoe, but, instead of canvas, aeroplane fabric is stretched over a light lathwork of wood. This construction is not obvious, however, and at first sight the body appears to be built of wood. At the rear of the body there is a capacious locker, access to which is obtained by raising the back rest.

Little can be said at the present time regarding the vehicle as a commercial proposition, but we understand that in all probability a company will be formed to market it. That it is more than the average experimental chassis put together to test an engine or transmission becomes evident when the car is examined.

The main object of our run in the car was to test the engine; and we can say that for a first engine of the batch about to be produced, it struck us as being remarkably quiet and flexible. The capacity is only 750 c.c., the bore and stroke being 80 and 78 mm. respectively, and since the car weighs about 8 cwt., gear changing was naturally somewhat frequent; but on the whole the vehicle had a good turn of speed, and whether in low gear or "top," engine vibration was unnoticeable.

The transmission is the subject of a pending patent, and therefore cannot be described. We think, however, that the designers will be well advised to instal larger countershaft pulleys.



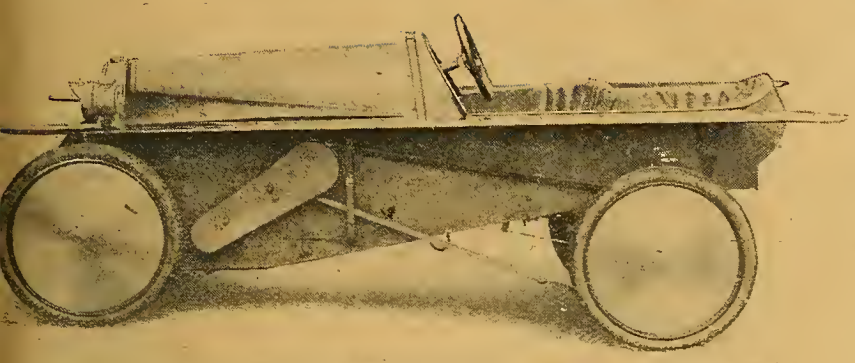
The light four-wheeler, in which the Coventry Victor Motor Co. are testing their new water-cooled flat twin engine.

A Novel Sidecar Alternative—the Tamplin.

A four-wheeled vehicle which created a great deal of interest outside the car and motor cycle shows is the Tamplin tandem-seated cycle car, which, in spite of its curious appearance, is possessed of many pleasing features.

An 8 h.p. air-cooled J.A.P. engine is located at the front end of the frame, the drive being transmitted, through a universal joint, to a chain sprocket on the near and outer side of the body, and thence through a standard Sturmey-Archer gear box to a single belt pulley on the live rear axle, which is mounted on large Skefko ball bearings, enabling the single belt to drive both rear wheels.

The Tamplin on the road requires careful handling during the first few miles of initiation, as the direct steering gear necessitates a very light touch on the wheel. Later, however, we found the control to be most satisfactory, and in dense traffic the narrow track and quick response to the steering wheel enable the driver to gain much advantage over larger vehicles. The comfort provided for the driver is excellent, but



A £150 tandem-seated runabout—the Tamplin, which is fitted with an 8 h.p. twin engine Sturmey-Archer gear box, and final drive by single belt to live axle.

ne accommodation for the passenger not over roomy. When fitted with windscreen and hood, the Tamplin hould be of great utility. The price of his machine, less accessories, is £150, nd it is manufactured by Messrs. 'amplin, Railway Garage, Staines.

A Four-cylinder Air-cooled Machine.

Another proposition designed as a idecar alternative, but which follows nore conventional lines, is the Barnard ycle car, which its makers intend to roduce at a figure comparing favourably vith the price of a sidecar outfit. £168 s the suggested figure for a standard nodel, but in order to permit its produc- ion at the price mentioned, such refine- nents as detachable wheels, reverse gear, nd dynamo lighting are omitted. A *de uxe* model will be made, however, in- corporating these features, the price of vhich will be £188.

The engine is a Henderson four-cylinder ower unit, arrangements for the import- ng of which are well in hand. As most

Canvas covers are used over chains to back axle on the Barnard cycle car.

notor cyclists know, the unit embodies a three-speed gear and multi-plate clutch, so the manufacturers are left very little to do but to connect it up to the rear axle by a chain.

An auxiliary cooling fan and a pedal starter worked by a rack and pinion will be embodied, however, whilst the trans- mission will be by a single chain from gear box to countershaft, thence by another chain to the centre of the rear axle. Provision is made for adjustment of both chains, and the countershaft runs on roller bearings of generous dimensions.

Two radius rods attached to the top and bottom of the axle sprocket housing are utilised to form a frame for the chain case, which is made of canvas fabric stretched over the rods and buttoned together.

Roller bearings are also used to support the rear axle, and quarter elliptic springs are fitted front and rear. The specification includes 700 × 80 mm. tyres and steering by double cable and bobbin.

The St. Mary's Engineering Co., 104, Whitechapel Road, E.1, are equipping a factory with the intention of producing vehicles immediately the power units are available from the U.S.A.

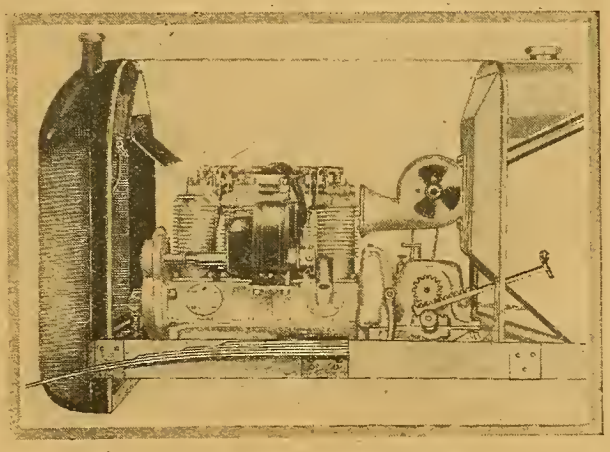
One of the earliest vehicles in the class under review was the Chater-Lea, which competed in a London-Edinburgh run several years before the term cycle car was originated. This machine was to all intents and purposes a redesigned quadricycle with the engine on one side and the drive taken to one of the rear wheels by means of a belt. The idea has been revived several times, and among the new propositions now reviewed there are two which follow the same general idea, while a third is undergoing experiments in the hands of one of the largest motor cycle manufacturers in this country.

The first is an Italian machine, and is interesting for the fact that it is a development of a machine designed to be steered by the feet.

Landini Foot-steered Runabout.

The first idea of the inventor of another vehicle, Signor Landini, the chief pilot at Cameri aerodrome, near Nevara, Italy, was to provide a light car which should accustom the pupils to control the direction of flight by foot instead of instinctively doing so by the hand lever, which is not intended for that purpose. A system was found to effect this, and the machine was put through regular road tests by the military authorities, and became the recognised first step to flying instruction at that school. The development of the idea for the help of the armless and maimed came as a matter of course.

The power plant is an 8 h.p. V air-cooled Stucchi engine mounted on the re-



The Barnard power unit, a 10 h.p. four-cylinder Henderson engine. Observe the fan and foot starter.

inforced right side footboard and driving the back wheel on the same side by chain through a two-speed gear integral with the motor.

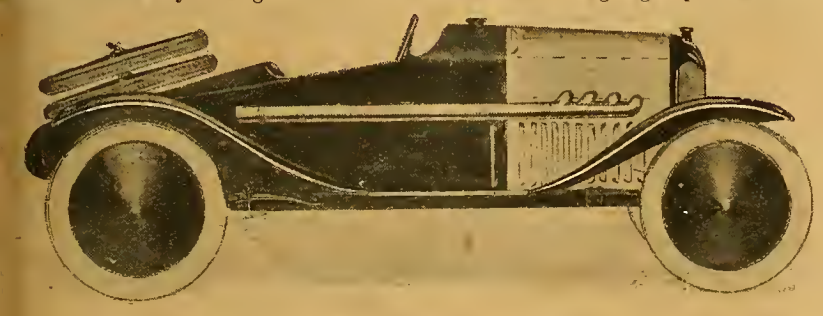
Steering in the original model was effected by a tiller-like bar pivoted at the centre and running transversely to the car's line of travel, slipping of the feet, which are accommodated in footrests at its extremities, being, of course, provided against.

A kick-starter or an automatic engine starter was fitted, and the gears and accelerator were operated by a sideways movement of the knees, much as is the swell of an harmonium.

One illustration shows a standard car with a gear lever in the normal position, which is a development of the first type towards a bigger and more usual type of four-seater which it is proposed to sell at a figure in the neighbourhood of £125, and which the Cameri works are now turning out in quantities. It is reputed to do fifty-five miles to the gallon.

La Rapide.

A machine, on similar lines so far as the layout is concerned, and called La Rapide, is about to be placed on the market by Mr. H. Jordan, of 7, Pall Mall, London. It is to be built in quan-



A sporting little vehicle, the Barnard embodying a four-cylinder motor cycle power unit.

The power and gear units in La Rapide are located in a compartment on the side of the body like the Scott Sociable.

C2

tity and marketed at £200. As in the Landini, a motor cycle power unit is located on the right side running board. Between the two special wings is a compartment in which is placed an 8 h.p. J.A.P. air-cooled twin engine driving through a chain to a three-speed Sturmey-Archer gear box and clutch, and thence by belt to the right-hand rear wheel. The front mudguard protects the engine and gear box, but at the side between the mudguard and the body there is a cowl which directs the air on to the engine cylinders, similar cowling allowing it to escape at the rear.

Steering is direct, and the chassis, composed of angle iron, has one forward and one rear cross-member, being mounted both at the front and the rear on quarter-elliptic springs.

We are informed that there will be a considerable number of modifications to the machine before it is ready for quantity production; for instance, the type of engine will be altered, a three-speed and reverse gear box of a different design will be fitted. Whatever the engine, however, an extension of the crankshaft will be brought under the driving compartment in order that a rack and pinion hand starting gear may be fitted, while on the same shaft a pulley will be placed to drive the dynamo, supplying current to the accumulators for two powerful side lamps and one tail lamp. The price mentioned includes these accessories.

There is a certain amount of experimental work to be carried out concerning braking systems and such minor points. At present internal expanding brakes are fitted to each rear wheel separately, operated by hand and foot respectively. The side-by-side seats are quite comfortable, and the body is equipped with the usual instrument board, hood, and screen. At the back of the seats is a large compartment to hold a suit case, spare petrol and oil tins, while below one running board there is a large tool locker.

The Marcus.

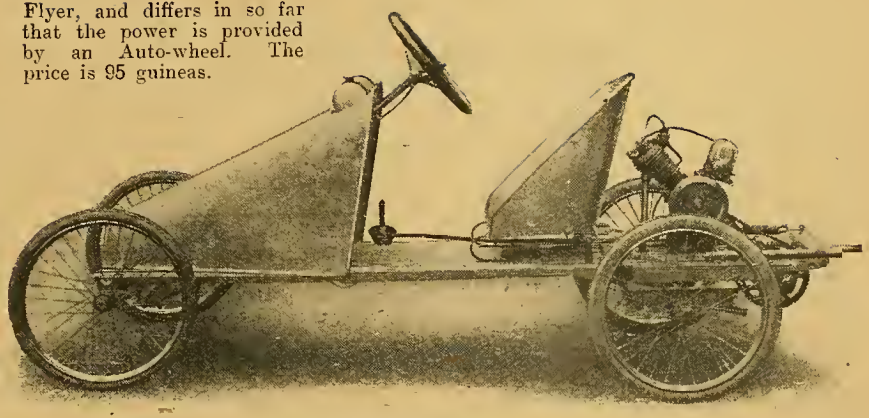
A little four-wheeler of the simple type, and one which closely resembles one of the early G.N.'s, is the Marcus runabout, designed to sell at £100. Originally known as the Challenge, this little vehicle has double quarter elliptic springs front and rear and is steered by cable and bobbin. The engine is located at the front, with the crankshaft across the frame, and drives by short chain to a gear box, from which a single belt transmits the power to a belt drum in the centre of the live axle. The maker is L. Marcus, 9, Golders Green Crescent, Hendon, N.W.4.

Provided the weight is kept low and a little more attention is paid to the design of the body, there are no reasons why the Marcus should not be a mechanical and a commercial proposition. The single belt for the final transmission should be satisfactory, as the Marcus is light, and the single belt is long and drives both rear wheels. The modern belt is a very different proposition from some of those which were sold before the war, and, after all, the chief failure of belt drive in 1911 was due to the inconsiderate use of expanding pulleys of too small a diameter.

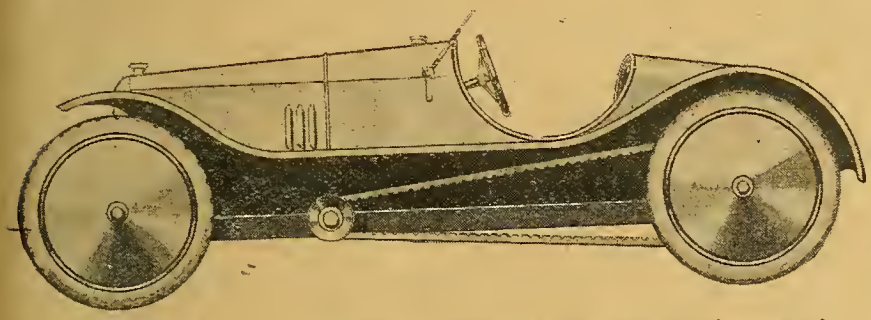
Four-wheeled Runabouts.—

The Buckboard.

The simplest of all new four-wheelers, the Grahame-White Buckboard, may be said to occupy the same position in the "car" world as does the scooter in the sphere of motor cycles. It is a small vehicle consisting of little more than a motor-driven rear axle and a front axle connected by a platform of wood without springs, the flexible qualities of the wood being considered sufficient to insulate the passengers from the worst road shocks. A 3 h.p. two-stroke engine provides the power, the transmission being by chain to a countershaft gear box at the rear of the platform, thence by belt to the axle. Incidentally, this Buckboard is a development of a little machine which has been marketed in America for some time; it is known as the Smith Flyer, and differs in so far that the power is provided by an Auto-wheel. The price is 95 guineas.



The simplest of all four-wheelers—the 3 h.p. Grahame-White Buckboard



The Black Prince £100 cycle car having two Union two-stroke engines, epicyclic two-speed gear and single belt drive.

Black Prince.

Another £100 proposition is the Black Prince runabout, a small four-wheeler embodying several features which depart from the conventional. The springing is by coil springs, and the power is provided by two Union two-stroke engines having a total capacity of 584 c.c. These are placed side by side in a vertical position, and depend upon a 180° magneto for ignition. An epicyclic two-speed gear is fitted at one end of a countershaft, at the other end of which is the pulley for the final single belt drive. The frame and body are made in one, and the total weight is said to be under 3 cwt. The manufacturers are Black Prince Motors, Ltd., Barnard Castle, Co. Durham.

1920 MODELS.

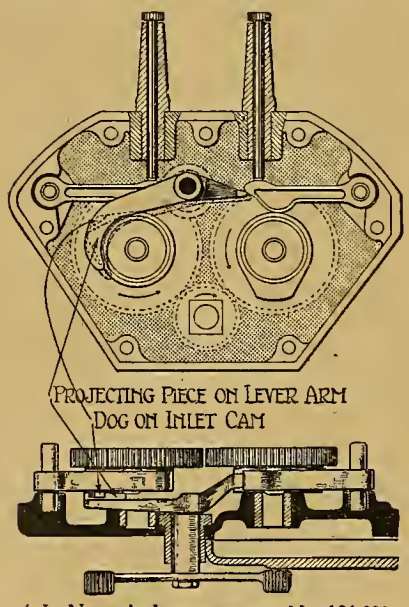
RECENT PATENTS.

REVIEWED BY B. H. DAVIES.

THE new Norton decompressor has the merit of being cheap to make and simple in action. The rider's control pedal rocks a short shaft, carrying a double-armed lever. With the control pedal in the operative position, a dog projecting sideways from the inlet cam engages another dog on one end of the decompressor lever, and lifts the other end of this lever, which in turn raises the cam runner interposed between the exhaust cam and tappet. The parts are, of course, so "timed" that the decompressor comes into action after the inlet stroke is complete.



L. Norton's decompressor. No. 126,200. 22/6/18.

A Scavenging Two-stroke.

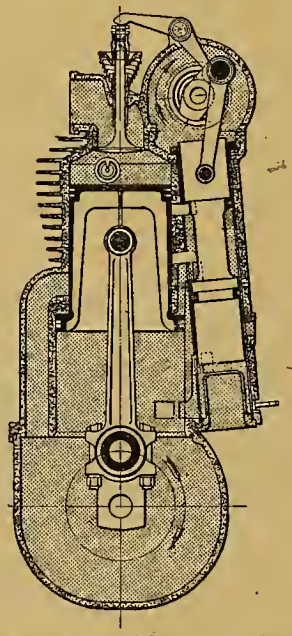
Messrs. Alexander and Halliday have designed a two-stroke engine with motives which seldom govern such labour so far as motor cycle engines are concerned. When an engineer concentrates his brain waves on a wee air-cooled two-stroke, he is usually thinking of the "dud" type of buyer, and trying to evolve a particularly *simple* engine, so that the wayfaring man, though a fool, may not err therein. The present inventors consider that the two-stroke has such an attractive *cachet* of its own that it is worth cultivating on other grounds, and seek to evolve what the knuts would term a "hotstuff" two-stroke; in doing so they have jettisoned the simplicity of the conventional three-port design, as will presently appear. As the drawing indicates, the piston is of the compound type, and the upper portion, *i.e.*, the smaller diameter, governs the explosion and exhaust strokes in the usual way. The ring-shaped ledge of the lower portion, which is of greater diameter, attends to induction and transfer, whilst the underside of the piston forces a scavenging blast of pure air up the transfer pipe at the left of the engine, and scours out the exhaust. The overhead poppet valve is an ordinary exhaust, and the slide valve on the right controls the ports essential to the rather complicated cycle. The cycle in outline is as follows:

1. Explosion occurs.
2. During the *descent* of the piston the control of the three ports in the right-hand side of the cylinder is as follows:

(a.) Top port (gas transfer) closed first by piston, and later by slide valve.

(b.) Middle port (intake from carburetter to large diameter of piston) opened part way down stroke.

(c.) Bottom port (intake for pure air required for scavenging) closed by slide valve.



Alexander and Halliday's two-stroke engine. No. 119,390. 20/2/18.

3. Two-thirds of the way down the stroke, the exhaust valve (poppet) opens, and immediately afterwards the scavenge transfer port on the left is uncovered, so that the scavenging blast of pure air is forced up into the combustion chamber, and drives out the burnt gases.
4. During the *ascent* of the piston, the action is as follows:

(d.) Slide valve closes the middle right-hand port.

(e.) Exhaust valve is mechanically shut.

(f.) The scavenge transfer port (on left) is covered by the rising piston.

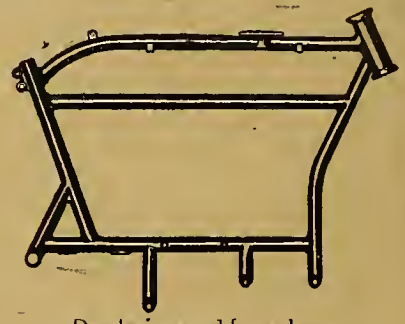
(g.) The slide valve opens the top right-hand port (gas transfer), and the very rich mixture, which is being compressed by the larger diameter of the piston, is driven up to join the less compressed air remaining in the combustion chamber from the scavenging portion of the stroke.

(h.) About halfway up the stroke, the slide valve opens the bottom right-hand port, and a fresh supply of air for scavenging purposes is drawn into the space beneath the piston. (This air is drawn through the hollow centre of the slide valve, and cools it.)

The name of freak two-strokes is legion, and engineers are apt to dismiss them with a sniff. The present example is admittedly very complex, but attains certain eminently desirable features. For example, no fuel enters the crank case: all the gas is burnt: scavenging should be excellent. The inventors hope to get double the power which a four-stroke of similar capacity would furnish, without exceeding its fuel consumption, *e.g.*, in a 3½ h.p. type to obtain double figure horse-power on 100 m.p.g., or thereabouts. These are tall claims. Would the engine keep cool? I would risk singeing my new Burberry leggings to find out.

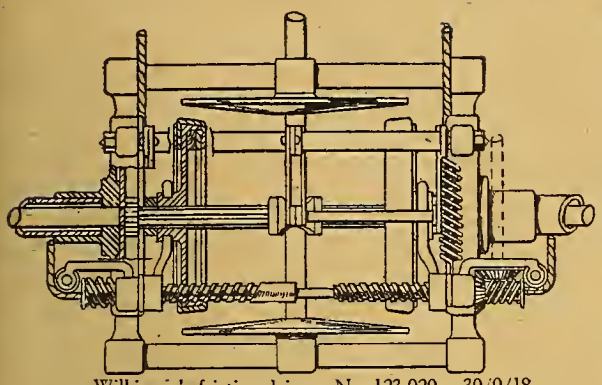
A Frame without Lugs

Messrs. W. W. Douglas and S. L. Bailey are associated in the invention of the new Douglas motor cycle frame, which differs from the conventional pattern in that it is devoid of the usual lugs and brazed joints. The fork ends of



Douglas improved frame dessgn No. 126,161. 13/5/18.

the rear chain stays are the only lugs used in the frame. All the other joints, including the attachments of the tank brackets, foot-rests, and brake pivots are acetylene welded, the ends of the horizontal tubes being mitred for the purpose. If preferred, the rear triangle of the frame



Wilkinson's friction drive. No. 123,929. 30/9/18.

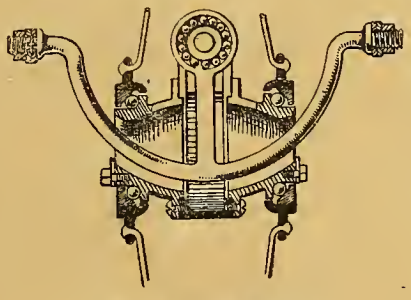
may be attached by bolts. The nett result of this method of construction is that the frame is lighter and cheaper than the standard pattern. It is further claimed that acetylene welding provides greater strength than lugs and brazing. Webs, fillets, and radius pieces may be added to confer additional strength or to improve the appearance.

Friction Drive.

An engineer resident in India, Mr. H. E. Wilkinson, has patented a most ingenious friction drive for cycle cars. It is not unlike the drive originally planned for the A.B.C. light car, seeing that it employs four friction discs to give the forward and reverse speeds, a clutch effect, and a differential. It may interest Mr. Wilkinson to know that the far simpler arrangement once contemplated for the A.B.C. was abandoned because it showed a very little saving in cost over a normal transmission of the positive type; and all his ingenious little control gadgets would render his system peculiarly expensive. To give a brief description, two discs are mounted on the driving-shaft, and a couple of driven discs are slidably mounted on half axles between the driving discs. Change of gear ratio is obtained by sliding the driven discs across the face of the driving discs; change of direction of drive—*i.e.*, from forward to reverse—is afforded by transferring each driven disc into contact with the other driving disc. A clever arrangement of a coarse pitch screwed rod with right and left hand threads, acting in conjunction with levers, is utilised to control the discs. The driver changes gears by operating a featherweight chain and sprocket gear, to which a lever may be fitted if preferred. The differential is not entrusted to enforced slip of the discs driving the inside half axle round a corner, after the brutal fashion accepted by certain other inventors. The control of the driven discs is linked up by a cable and bobbin arrangement to the steering column of the cycle car, so that the inside road wheel is geared down automatically in proportion to the abruptness of the curve or corner.

Wheel Steering.

Mr. W. G. Moore, of Indianapolis, is dissatisfied with the standard steering of motor bicycles, and has patented the somewhat complex device shown in the accompanying drawings. It is impossible to elucidate this system fully in the space at my command, and the task must chiefly be entrusted to the sketches. On ordinary machines the steering head is too short, and too far behind the wheel axle, whilst road shocks are transmitted to the steering head with considerable leverage as the result of the construction. Under Mr. Moore's system the distance between the upper and lower steering head bearings is about 18in. in the case of a 28in. wheel, and the axis of the steering head is only an inch or two behind the wheel spindle. For readers who do not easily follow mechanical drawings, I may explain that the wheel is carried in an inverted U-shaped "yoke," of which the side members slide in guides formed in the motor cycle frame. The up and down motion of the U shaped yoke is restricted by

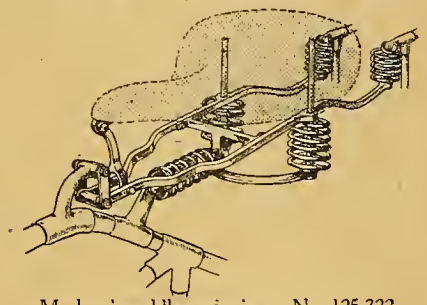


W. G. Moore's steering adjustment. No. 125,780. 30/4/18.

strong coiled springs, anchored at their top ends to the yoke, and at their lower ends to the guides in the frame. The tips at the base of the U are connected together by a bowshaped bridgepiece. Turning to the steering head, a stub stem projects above the crown of the steering fork, and is provided with an upper ball bearing housed in the top centre of the U shaped yoke. The fork possesses the usual pair of side blades, which are connected by a bolt and nuts to the axle on which the wheel hub revolves. The axle is in the form of a hollow barrel. The lower ball bearing of the steering head is mounted in line with the upper bearing, but inside the wheel and an inch or or two behind the hub axis. Further reference to the small sketch shows how this bearing is arranged. For steering purposes two arms project to the rear from the crown of the steering fork. A steering wheel is utilised in lieu of the usual handle-bar, and it is claimed that the steering is easy and sensitive.

Saddle Springing.

I am never quite sure whether the merchants who patent spring mountings for saddles hold cynical opinions of spring frames, or wish to propound a cheap substitute for the more complete type of insulation. Mr. J. P. Maclean's

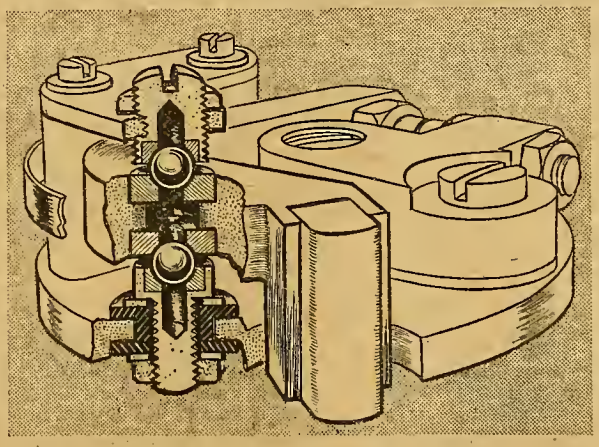


Maclean's saddle springing. No. 125,322. 11/9/18.

design is self-explanatory. He mounts his saddle on a frame which is sprung against both vertical and horizontal shocks. The rear ends of the frame are suspended vertically on coil springs from the side bars of the carrier. The front end of the frame is hinged to swing horizontally from a davit, and this motion is restrained by the lower spring shown in the sketch.

No More Sticking Rocker Arms.

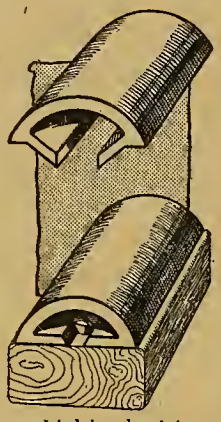
Much ingenuity has been lavished of late on magneto contact breakers, partly with a view to the prevention of stuck rocker arms in damp weather, partly to withstand the colossal rate of oscillation required by modern aero engines with nine or more cylinders. Mr. Finch's design appears sound from both points of view. He provides a compact and simple ball bearing on each side of the rocker arm, for which two small balls suffice. Each ball is housed in a pair of half cups, one of which is formed in the rocker arm itself, and the other in an adjustable steel screw. The screws are drilled out axially to contain lubricant. I am informed that the bearings withstood a seven-hour test at the rate of 12,600 oscillations per minute. To prove that no grease could escape from the bearing and oxidise the platinum points, a sample contact bearing was immersed in sal ammoniac for several hours, after which period no rust was present in the bearing.



The Finch ball-bearing contact-breaker rocker.

SIDECAR BEADING WITH INVISIBLE FIXING.

ALUMINIUM beading is used quite extensively in car body building, and of late there has been a tendency for makers of high-class sidecars to finish their cars in this way. The one disadvantage of this beading has been the number of small screws required which, after a little use, become rusty and also collect dirt. Mr. C. R. Little, of 14, Butcher Row, Coventry, has patented a beading section and a method of fixing by which the latter is invisible.



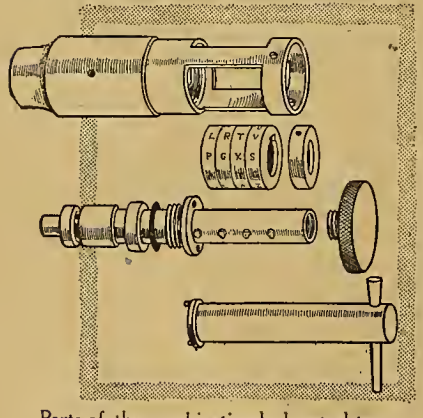
Little's aluminium beading for sidecar bodies. The method of fixing is concealed.

Screws are fixed to the wooden "rail" at intervals, and the bead is so sectioned that it slips over the heads of the screws, the slot being closed when the head is "hammered" down by means of a mallet and a special tool similar to that used by blacksmiths for "swaging."

AN INGENIOUS ANTI-THIEF DEVICE.

BY utilising the principle of the letter lock in an invention for preventing the theft of a motor cycle, Mr. H. Birch, of 109, Lansdowne Road, Tottenham, London, N.17, has prodnced a lock which will baffle the motor cycle thief.

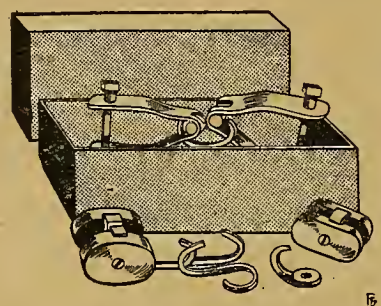
The idea is to place the petrol unions in position at a small hole in the body of the device. When a certain combination of letters has been brought into line it also brings into line four slots in the rings upon which the letters are engraved. These engage with four tiny spring bolts in the spindle attached to the petrol tap. When the correct combination has been found to open the petrol tap it is only necessary to pull up the milled nut on the head of the central tube. It is quite easy to take the device to pieces. When the correct combination has been lost it is impossible to turn on the petrol.



Parts of the combination lock petrol tap.

STANLEY SPARES.

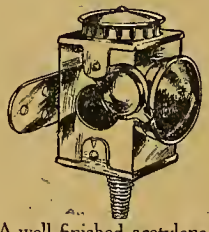
A USEFUL item for the toolbag of belt-driven machines is a box of Stanley spares, which the Stanley Belt and Fastener Co. are now marketing. It contains a belt fastener, spare link, a belt shield, and a set of hooks.



Box of Stanley belt-fastener spares.

THE RADMILL REAR LAMP.

THE Mohawk Cycle Co., Hornsey, N., have recently placed on the market a neat sheet metal rear lamp of sturdy construction, which we illustrate herewith.



A well-finished acetylene rear lamp.

THE SENSITIVE CONTROL.

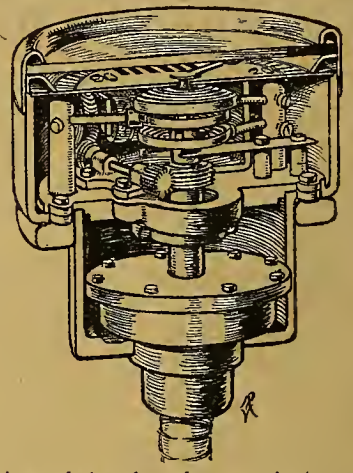
A NEW form of control, devised to enable a motor cyclist to open the throttle suddenly independently of the air control levers, has been invented by Mr. J. Gordon-Hall, 5, Albany Court, Piccadilly, London, W.1.

The Sensitive control lever, it will be noticed, is fitted underneath the handle-bar and adjacent to the handle-bar grip. It works on the pulley block principle, and, while the ordinary throttle lever may be set just a shade open, the Sensitive control lever can be opened independently of it, and when released will only allow the throttle to close to the degree controlled by the throttle lever. Also it allows the throttle to be opened suddenly, and as it is conveniently placed on the handle-bar it will enable the air to be opened at the same time, so that the mixture is not upset. The control is enclosed in a neat case, not shown in the illustration.

A SPEEDOMETER ON A NEW PRINCIPLE.

A NEW speedometer, which created a great deal of interest at Olympia, and which is known as the Atmo, is being marketed by Stanley J. Watson, 37, Sheen Road, Richmond.

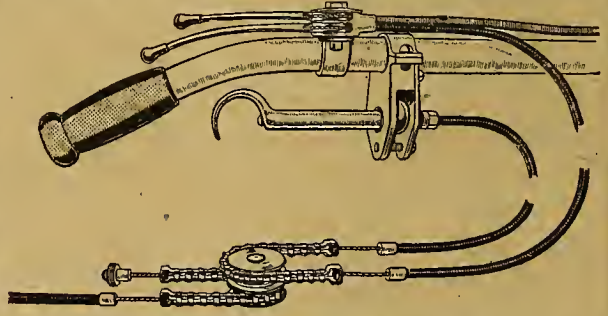
Its operation is governed by the friction set up between a revolving film of mercury and a stationary metal disc. The flexible shaft, by which the instrument is driven, is connected to a closed drum containing mercury, through which passes the spindle connected to the finger pointer, which is seated upon a jewel bearing at its lower end. Two discs are attached to the spindle inside the drum, one of which, the lower, is in contact with the mercury.



A new design of speedometer—the Atmo.

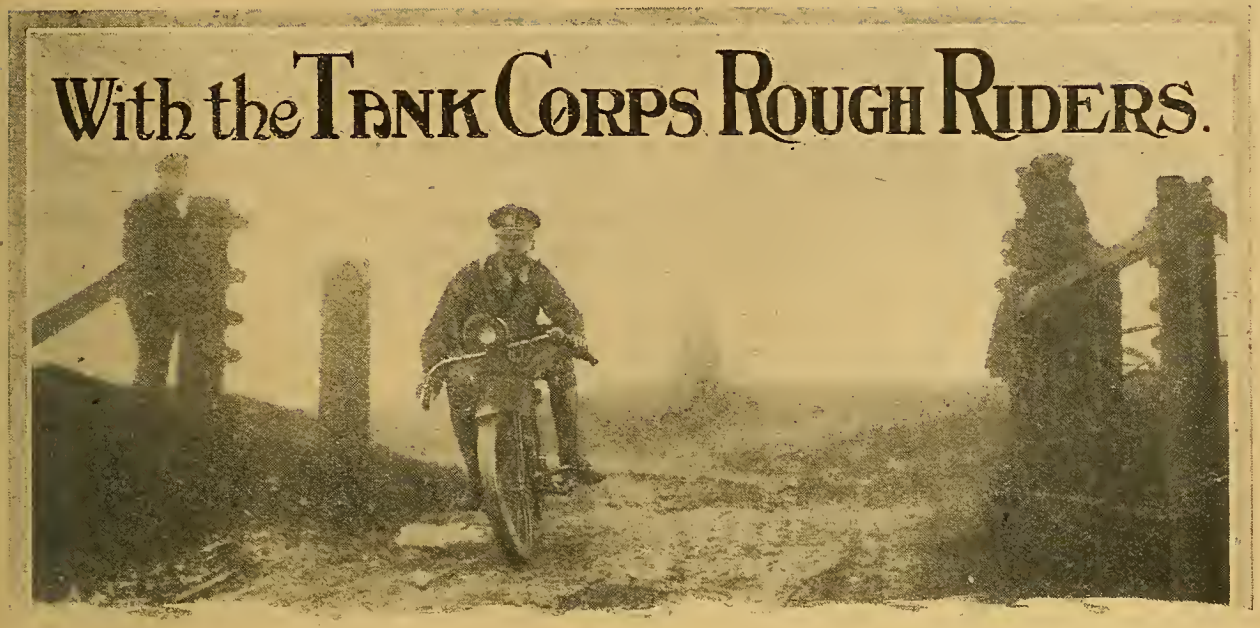
As the drum is caused to revolve, the drag between the mercury and the disc tends to turn the spindle, but is prevented from doing so by three spiral springs of different strengths, which come into action successively. A little consideration will show that as the speed of the drum increases, the drag becomes greater, and the tension on the springs is overcome, which forces the pointer round the index dial. At high speeds the mercury is thrown by centrifugal force against the walls of the drum, bringing the second disc into operation, and so increasing the friction.

During a close examination of the instrument in operation we were surprised at its steady registration.



A "sensitive" finger throttle control mounted on the handle-bar and connected with chain and pulley actuating device. (This is shown detached from casing to indicate chains and pulleys.)

With the Tank Corps Rough Riders.



Capt. Miller (5-6 h.p. Zenith), winner of *The Motor Cycle* Cup, negotiating a bend on Whiteway's Hill. This hill was climbed in a thick mist and rain.

MOTOR cyclists of the Tank Corps have formed a club of their own. The opening event took place over the Purbeck Hills on Wednesday last week. A well planned course, over a distance of about fifty miles, had been arranged with a view of providing the usual tests of reliability; but the severity of the trial was considerably enhanced by the weather encountered, which consisted of a most unsavoury mixture of fog and rain.

The starting point for Wednesday's run was at Wool, and from there the Dorchester Road was followed to Owermoigne. Here the competitors left the main road, and encountered some very bad surface on the way to Bere Regis *via* Puddletown. Through the training area and into Wool again proved easy riding, as the road was familiar to all, but the long climb through Coombe Regis to East Lulworth made a bad preface to Creech Barrow Hill, which was under observation.

The going was extremely rough in places, but the men who man the tanks are used to rough riding, and it speaks for their enthusiasm as motor cyclists that they did for pleasure and sport what they are often called upon to do when aboard their tanks.

Unfortunately, only twelve of the seventeen entrants faced the starter, and of these six finished. There would have been more no doubt, but since the trial was first mooted many supporters of the club have been demobilised.

Individual Performances.

Capt. Frost (3¾ Scott) made very good performances on all hills, but he lost marks at each check, and had the misfortune to break his magneto chain. He finished, however. Sgt. Sharp (3½ Rudge) suffered from no fewer than three burst tyres, and was forced to retire.

Lt. Lever (4¼ B.S.A.) made good ascents of all hills but Kingston, on which he was only moderately good. In the acceleration test his performance was good, and his loss of marks on time was only four. Capt. Perry was less fortunate in this connection, and lost twelve marks on time, but made a better showing on hill-climbing. Capt. Bradley (3½ Premier sc.) lost his way, and Lt. Male (3½ Rudge) retired through lubrication defects.

Capt. Fairbank, who made the best performance in the trial, lost one mark only, and this was in the acceleration test. His machine was a J.A.P.-engined mount assembled by himself, and had a Chater-Lea frame.

The most plucky performance was made by Capt. Miller (5-6 Zenith), to whom the judges have awarded *The Motor Cycle* cup for the best performance in face of adversity. Capt. Miller had not ridden the machine prior to the trial; moreover, it was an antiquated model, badly shod, and in a generally bad condition. He rode without coat or macintosh, and, in spite of breaking the throttle wire, he cheerfully finished the course with the bare wire in his hand with a loss of only nine marks.

Awards.

Best performance of the day.—Capt. Fairbank (8 J.A.P. sc.).

First Class B.—Sgt. Smith (3½ Rover).

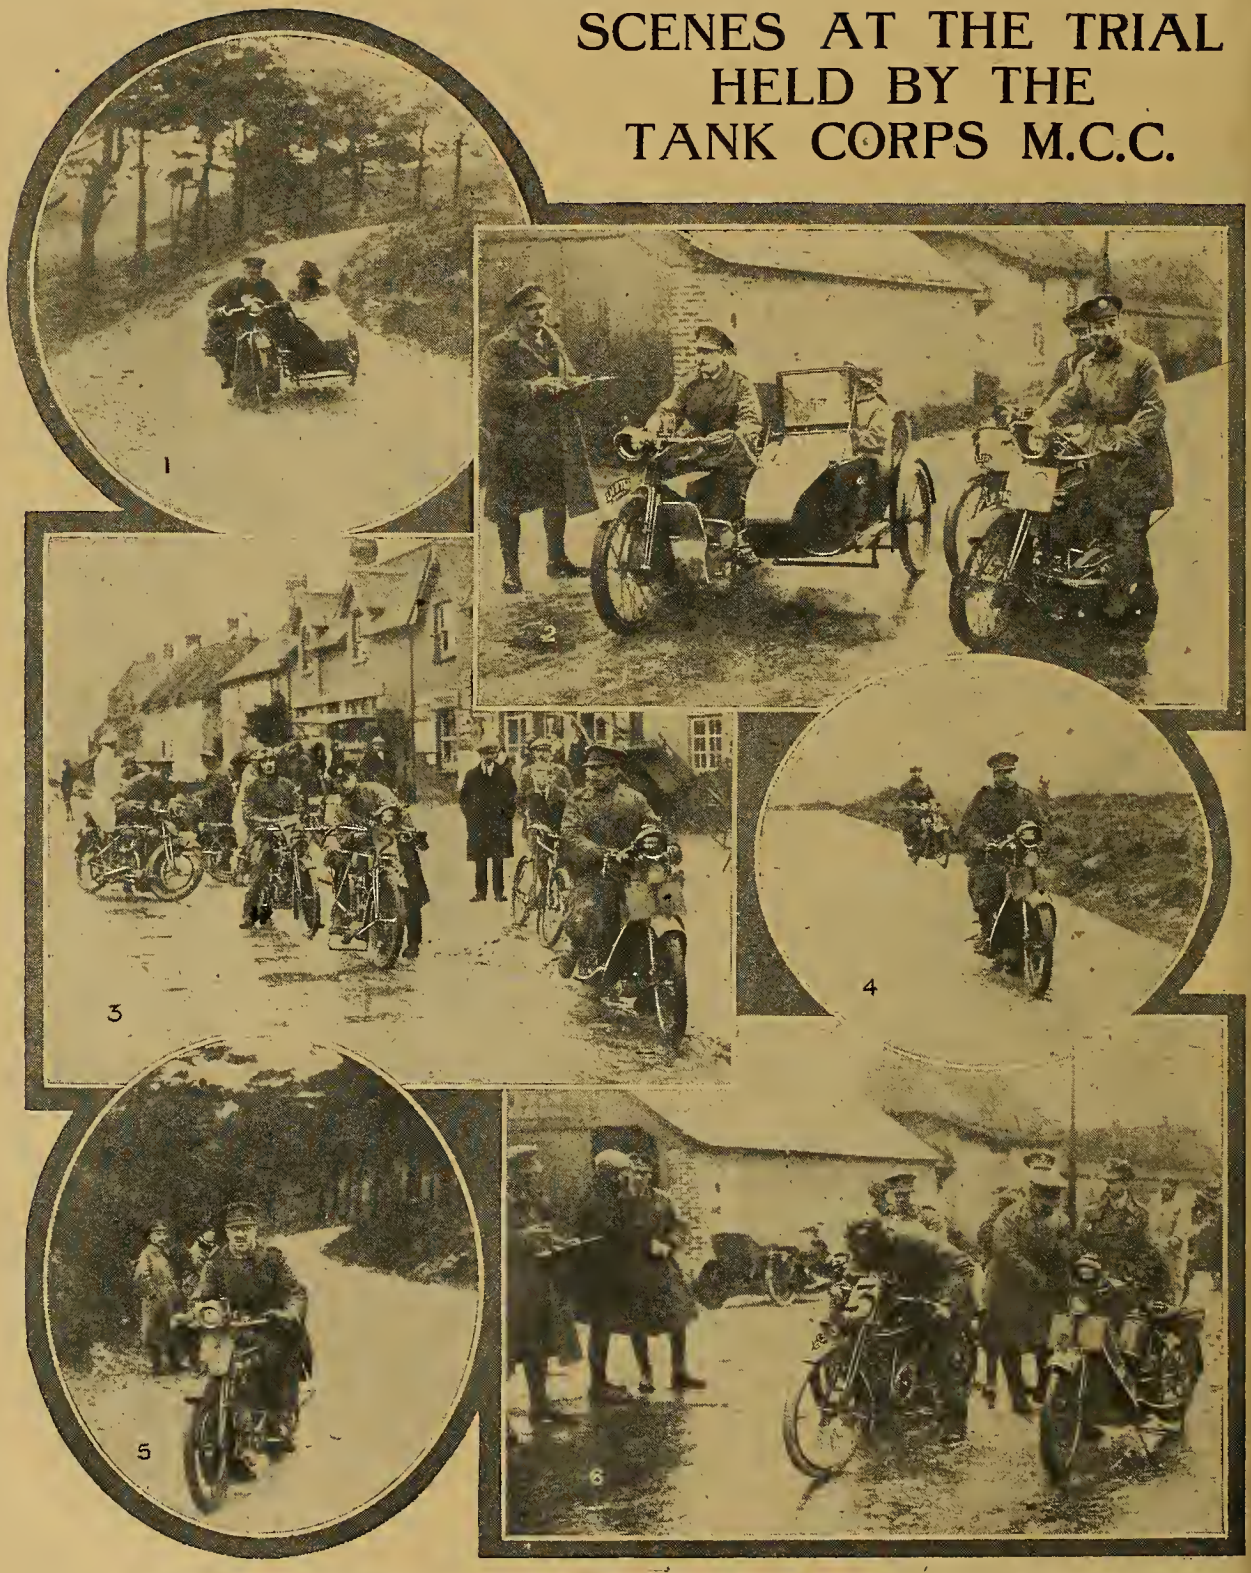
Second Class B.—Lt. Lever (4¼ B.S.A.).

Third Class B.—Capt. Perry (4 Triumph).

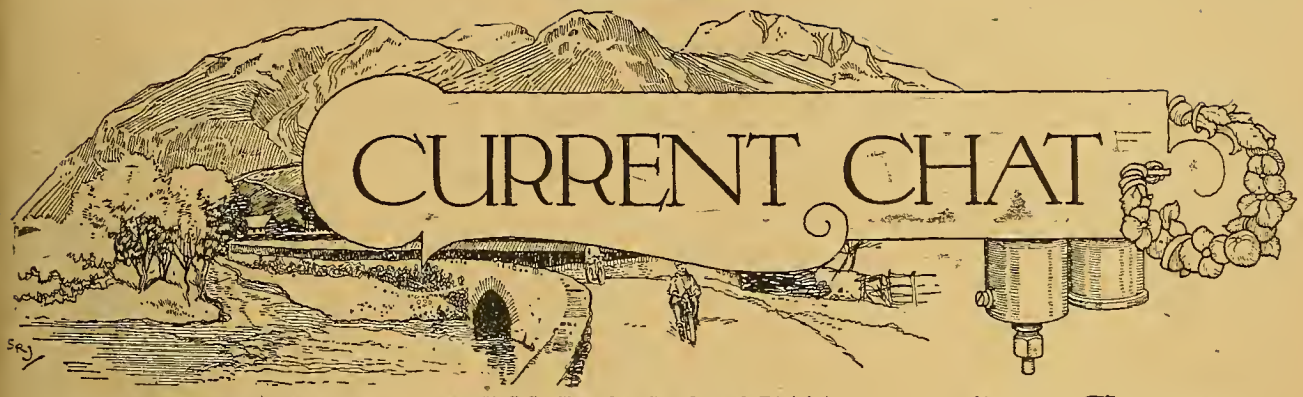
The Motor Cycle cup for the best performance in face of adversity.—Capt. Miller (5-6 h.p. Zenith).

AT THE START OF THE TANK CORPS TRIAL. Among the makes of machines represented were the Premier, Triumph, Scott, B.S.A., and Rover.

SCENES AT THE TRIAL HELD BY THE TANK CORPS M.C.C.



(1) Capt. Fairbank on Gallows Hill. (2) Col. Sacks starting the men from Wool. (3) Capt. Frost (Scott), Sgt. Sharpe (Rudge), and Lt. Head (Douglas) at the commencement of the trial. (4) Capt. Frost on the way from Bere Regis. (5) Lt. A. W. Lever (B.S.A.) on Gallows Hill. (6) Lt. Head (Douglas) starting away.



Times to Light Lamps.

GREENWICH TIME.

Dec. 11th	...	...	4.20 p.m.
,, 13th	..	...	4.19 ,,
,, 15th	...	...	4.19 ,,
,, 17th	...	...	4.20 ,,

A.C.U. Competition Expert.

The name of Mr. G. E. Kuhn has been added to the "competition experts'" list of the Auto Cycle Union.

Observers for London-Exeter.

A few motor cyclists who would act as observers on Trow Hill, near Sidmouth, are required for the M.C.C. London-Exeter run on December 26th and 27th. Those willing to give their services on this occasion are requested to communicate, as soon as possible, with Mr. Frank Hansford, Ilminster.

Motor Cycle Records.

A new edition of "British Motor Cycle Records" has been issued by the A.C.U., and existing records for all powers and recognised distances are clearly tabulated. Copies, price 6d. post free, may be obtained from the Secretary, A.C.U., 83, Pall Mall, London, S.W.1.

A Warning to Motorists.

Many complaints of inconsiderate driving of cars and motor cycles have of late been received by the R.A.C. and A.C.U., notably on the Great North Road and on the London-Hastings road through Dunton Green, Riverhead, and Sevenoaks, where the police have received instructions to enforce the legal limit. It is believed that most of the offenders have acquired their machines since the Armistice, and are not acquainted with the ordinary courtesies of the road.

The A.A. Benzole Test.

The report of the A.A. 10,000 mile benzole test carried out on the Sunbeam car is now out of the printer's hands, and copies may be obtained from the offices of the Automobile Association, Fanum House, Whitcomb Street, W.C.2, the price being 3s. 6d. post free. Despite the fact that the mean weight of the car on the road was 1.8 tons and that the average speed over the total distance was in the region of 23 m.p.h., the average consumption was 24.57 m.p.g. The report of the motor cycle test of 5,000 miles on Triumph machines is expected in the near future.

An M.C.C. Club for Crook and District.

A club has been formed by motor cyclists in the Crook district, Co. Durham, and others who are interested are advised to communicate with the hon. sec., Mr. A. F. Chandler, 10, Alexander Terrace, Crook, Co. Durham.

The Blaenavon M.C.C. Dinner.

The first annual dinner of the above club will be held at 6 p.m. on Wednesday, December 31st. All local motor cyclists are invited to attend. Tickets, price 5s. each, may be obtained from the hon. sec. at the Prince of Wales Hotel.

Cardiff M.C.C. Reliability Trial.

The Cardiff Motor Cycle Club (late Cardiff City and District Motor Cycle and Light Car Club) recently held a very successful consistent driving and reliability trial. The course was forty-two miles, mostly over country lanes and third-class roads. The winner was the competitor who lost the least number of marks on observed hills, etc., and who maintained the average speed—16 m.p.h. Result: First, D. McKenzie (4 Douglas sc.), 3m. 48s. late; second, P. White (5-6 Brough), 3m. 50s. early; third, J. E. Cleverley (B.S.A.), 5m. 30s. early; fourth, A. Thom (7-9 Harley-Davidson).

IN THE CORNISH BY-LANES.
The Royal Ruby is negotiating Black Hill near Trebarwith Strand Beach.

Special Features.

THE YEAR'S COMPETITIONS.
WHAT THE LADIES THINK.
FOUR-WHEELED RUNABOUTS.

Provincial Government Sales.

The Ministry of Munitions is arranging a further provincial sale of motor cycles at Edinburgh on the 22nd inst. The auctioneers are J. Croall and Sons, Castle Terrace, Edinburgh. The last sale was held at Halifax on Tuesday, the 9th inst.

Government Sale of Motor Cycles To-day.

A further sale by the Ministry of Munitions of a large number of motor cycles is advertised to take place to-day (the 11th) at Earl's Court. The lots include Douglas, P. and M., Clyno, Indian, B.S.A., and Scott machines, many with sidecars; also 140 cases of spares and accessories for Douglas and Enfield machines. The first item will be offered at 2.30 p.m.

Silver Cup and Bowl for Plymouth M.C.C.

The prospects of the sporting side of the Plymouth and District M.C.C. for next year are very good. A silver bowl has already been offered by Mrs. Snell, of Plymouth, for a reliability trial, while a silver cup has been presented by Mr. Clarence Spooner, of Plymouth, for a hill-climb. The yearly subscription of the club is 10s. per annum, but it has been reduced to 5s. for the rest of the year. The hon. secretary, Mr. Lionel B. Jackson, The Old Grammar School, Plympton, will be glad to receive names of prospective members.

United R.A.S.C. Club.

At a recent conference at the War Office it was decided that the new Royal Army Service Corps Club, in course of formation, should be named the United R.A.S.C. Club. Membership is to be open to officers of all branches of the corps, namely, to officers of the Regular Army, Special Reserve, Territorial Force, temporary officers of the R.A.S.C. who served during the war, Motor Volunteer Transport Corps, officers of the corps in Overseas Dominions, also to the Indian Supply and Transport Corps. All officers who have served in any branch of the corps, whether on the active lists, retired, or demobilised, will be eligible for election.

Four Hundred Miles Non-engine Stop.

Late on Thursday night last the G.N. cycle car, driven by Rex Mundy, arrived in Edinburgh, after completing the long journey from London without an engine stop. The run was accomplished under R.A.C. observation, and a 20 m.p.h. average was maintained. This is the first time that an air-cooled engine has propelled a vehicle over this course under official observation with the engine running continuously. Apart from testing the 10 h.p. G.N. itself, National benzole, Cooke plugs, Sthenos carburetter, and an Easting windscreen of a new pattern were fitted to the small car. Other equipment carried included Smith's speedometer and dynamo lighting set. Palmer cord tyres were fitted, and Coolie oil was used for lubrication. A test of this description is almost equally one of the driver's skill as of the reliability of the machine.

The Price of Petrol.

The price of petrol in this country is twice the amount charged in New York. It is delivered to the tankers for shipment to England at less than a shilling per gallon, yet motorists on this side of the Atlantic are called upon to pay three times this amount. Until Britain produces fuel at a reasonable price, motorists will always be at the mercy of the Trusts.

Petrol Profiteering?

The committee formed to inquire into petrol prices under the Profiteering Act will consist of Mr. P. G. L. Webb (Board of Trade), Mr. W. H. L. Paterson (Petrol Control Board), Mr. A. Smith (Vehicle Workers' Union), representatives of the A.A., the Commercial Motor Users' Association, Sir Wilfred Stokes, K.B.E., Mr. Frank Chitham (director of Harrods, Ltd.), and Baillie P. Gillespie (Secretary Horse and Motormen's Union). This committee will inquire into the reasons for the difference between the landing price of petrol, 1s. 9½d. per gallon (including tax), and the retail price, 3s. 0½d. per gallon.

A Boxing Day Social Run.

The Birmingham Branch of the N.M.C.F.U. are holding a social run on the 26th inst. to the Red Lion Hotel, Knowle, starting from the Swan Hotel, Yardley, at 10.30 a.m.

Obstruction by a Char-a-banc.

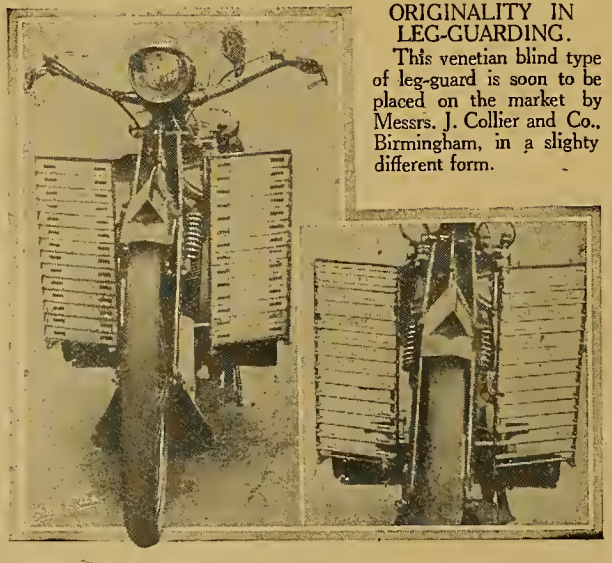
The Automobile Association recently prosecuted the driver of a char-à-banc who was alleged to have wilfully obstructed a member's car for a considerable distance.

Having regard to the fact that the driver had been discharged from his employment, the case was not pressed, but it was stated that the case had been brought forward as a warning to others.

The Bench dismissed the case with a caution, warned owners of other chars-à-bancs of the consequences of further obstructions of this kind, and expressed the opinion that every char-à-banc should be provided with a conductor, who would have the means of communicating with the driver. The Bench thanked the A.A. member for bringing the case forward.

The Genuine Lightweight.

There are several designers of scooters who are seriously thinking of the possibilities of a genuine lightweight which will be almost as light as a scooter, but have greater scope. We have welcomed the advent of the scooter because in it we see the nucleus of the real lightweight.



ORIGINALITY IN LEG-GUARDING.

This venetian blind type of leg-guard is soon to be placed on the market by Messrs. J. Collier and Co., Birmingham, in a slighty different form.

Extra Capital.

It is proposed to increase the £200,000 capital of J. B. Brooks and Co., Ltd., to £300,000 by the creation of 100,000 additional shares of £1 each. An extraordinary general meeting is being held on Monday next at the Chamber of Commerce Buildings, Birmingham.

Wooler Developments.

The manufacturers of the Wooler motor cycle and three-wheel runabout are floating a company with £200,000 capital. We understand that the prospectus will be issued to-day, the 11th, and that the title of the company will be the Wooler Motor Cycle Company (1919), Ltd.

Criticising New Designs.

An instructive address by Mr. Douglas Leechman was given to members of the Essex Motor Club and others at the Royal Automobile Club, Pall Mall, during the Olympia Show. The lecture constituted a severe criticism of the new features incorporated in the design of new models exhibited at Olympia. Spring frames were enthusiastically discussed.

M.C.C. London-Exeter Run.

Up to the 5th inst., the following additional entries have been received for the above trial, bringing the total up to 103. The event is to be held on Dec. 26th.

SOLOS.
K. V. Chidley (2¾ Wooler)
L. Pulham (3½ Ariel)
A. J. Sproston (3½ M.A.G.-Lea-Francis)

BRISTOL LAND'S END TRIAL ON BOXING DAY.

IN pre-war days the Bristol Club's Christmas trial to Land's End and back was one of the most strenuous of the year. Many riders have vivid recollections of the all-night journey over the coast roads of North Devon. To climb Porlock and Lynton hills in the wee small hours in pouring rain and a gale of wind furnished sufficient excitement for the most hardened of trial riders.

The objects of the trial are commendable. They are to demonstrate that modern motor cycles can be driven over 400 miles at an average speed of 20 m.p.h. in mid-winter over what is perhaps the most difficult main road route in the country. It will prove also the efficiency or otherwise of modern lighting arrangements, as competitors are compelled to ride in at least fifteen hours of complete darkness.

The outward route will be Bristol, Bridgwater, Porlock (control), Lynmouth Barnstaple, Bideford, Holsworthy, Launceston, Truro, Penzance, Land's End (control).

The return journey will be *via* Penzance, Truro, St. Austell, Tavistock, Liskeard, Two Bridges (control), Ashburton (control), Exeter, Taunton, Bridgwater, Bristol. No secret checks will be taken, nor will any observed hill be included.

Gold medals will be awarded to all who do not exceed five minutes variation at each check, silver medals up to ten minutes error, and bronze medals up to fifteen minutes error, with the exception of Lynton check, where the error allowed will be fifteen minutes, twenty-five minutes, and fifty minutes respectively.

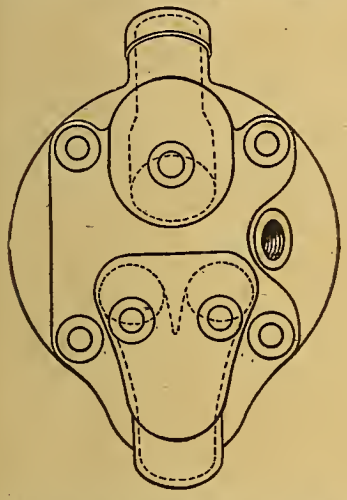
Those intending to compete should communicate with the secretary, Mr. Allan King-Smith, near Bristol. Entries will close on the 18th inst., late entries at double fees first post on the 22nd. The fees are £1 10s. for trade entrants, 15s. non-trade; club members 25s. and 10s. 6d. respectively.

Motor Cycle Engines with Overhead Cams.

The Metric Range of Engine Units which follow Advanced Lines.

FOR some time car engine designers have shown a tendency to consider overhead valves operated by camshafts over the cylinder heads, and at the Paris Salon the Louis Clement motor cycle created a great deal of interest, chiefly on account of its overhead valve gear.

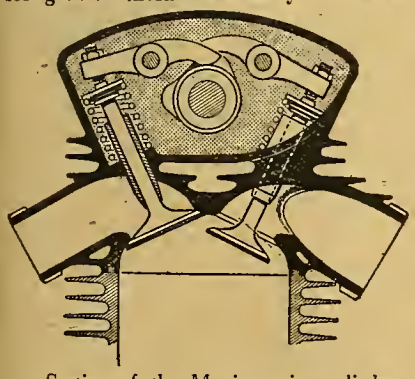
There is nothing really new in this principle; in fact, an experimental Norton of about 1912 had an overhead camshaft driven by a chain, and a little four-cylinder V air-cooled engine prodnced in



Plan view of cylinder head of the racing model, showing location of the twin exhanst valves, inlet pocket, and sparking plng hole.

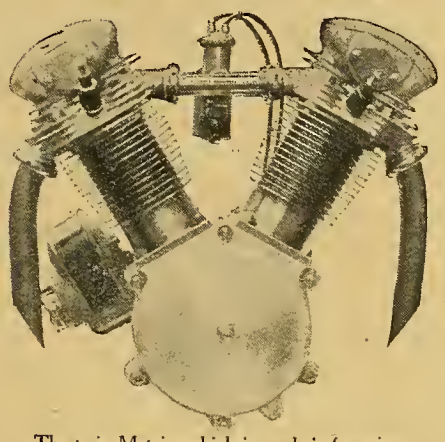
America some time ago for cycle cars also had a chain-driven camshaft located overhead.

It is generally conceded, however, that the overhead valve engine is more efficient than the side-by-side type, partly on acconnt of the fact that a hemispherical combustion head is possible, which makes for greater thermal efficiency. Whether



Section of the Metric engine cylinder head. The valves are operated by rockers, and an overhead camshaft contained in a casing cast in one with the cylinder head.

overhead valves are operated by push rods from a cam chamber on the side of the crank case, or by cams immediately adjacent to the valves, is not a matter affecting thermal efficiency, but rather



The twin Metric, which is made in four sizes.

one of refinement in design. Nevertheless it is interesting that a new firm of engine unit manufactnrers has decided to market a range of engines embodying overhead camshafts. This firm is the Metric Co., of 55, Victoria Street, London, S.W.1, and the engines of its manufacture which we have inspected show distinct promise.

Consistent h.p. Rating.

The range of engines is rather more extensive than one expects from a new firm entering the field, hut many use the same cylinders and other important component parts, so that the production of the eight sizes does not necessarily mean eight different designs. The sizes are as follow:

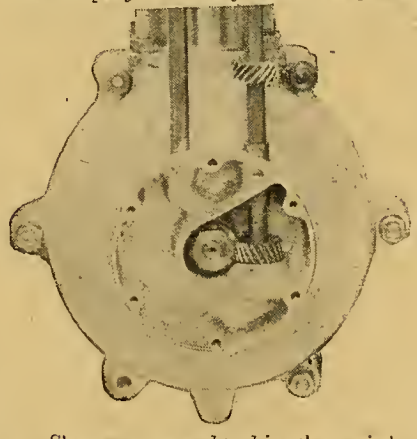
SINGLE CYLINDER.

2.5 h.p., 64×80 mm. (255 c.c.).
3.2 h.p., 64×100 mm. (320 c.c.).
4 h.p., 80×80 mm. (400 c.c.).
5 h.p., 80×100 mm. (500 c.c.).

TWIN CYLINDERS.

5 h.p., 64×80 mm. (510 c.c.).
6.4 h.p., 64×100 mm. (640 c.c.).
8 h.p., 80×80 mm. (800 c.c.).
10 h.p. 80×100 mm. (1,000 c.c.).

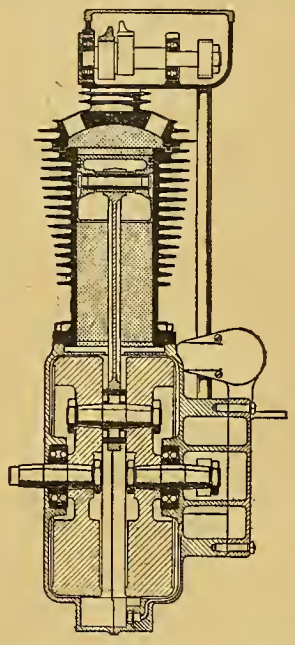
Incidentally, we are glad to see that this company nominally rates the power



Skew gears are used to drive the vertical shaft of the valve mechanism. The gear wheel above drives the magneto.

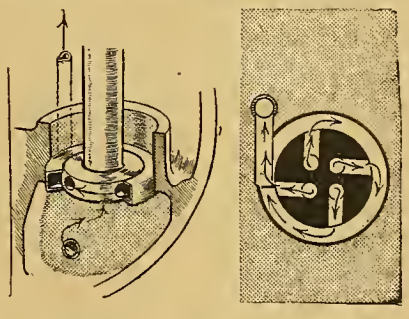
of its engines by a definite rule founded upon the cubical capacity of the cylinder, and that, as suggested several times in *The Motor Cycle*, 100 c.c. is regarded as representing 1 h.p.

Having a hemispherically-shaped combustion space, the cylinder heads are detachable, and have integral with them a casing containing the camshaft, which runs on a double row of hall bearings.



Cross section of the single-cylinder engine, showing the overhead camshaft.

The camshafts are driven by skew gears in the timing case, and by similar gearing in the cases on the cylinder heads. The vertical shafts carrying these gears are



The oil pump shown in part section and in diagrammatic form. The rotating member, driven from the camshaft skew gear, throws oil by centrifugal force into an annular chamber and thence through a pipe to the crankshaft, and to the overhead valve gear on each cylinder head.

enclosed in long tnbes, but on one shaft, about midway, there is a third gear wheel which drives the magneto.

Off the timing gear there is also driven a centrifugal pump, drawing oil from

Motor Cycle Engines with Overhead Cams.—the base of the timing case up a separate pipe to the camshaft casing, and preserving therein a constant level of oil about a quarter of an inch in depth, while the oil pipe is enclosed within another so designed that any excess of oil runs through the outer pipe back again into the timing gear, thus maintaining constant circulation. Provision is made so that oil cannot leak from the camshaft casing into the combustion chamber, as the oil level is well below that of the top of the valve guides, the stems of which are always working in an oil vapour.

The whole of the design has been carefully thought out, and one of its principal features is the interchangeability of parts. The main-shaft runs on ball bearings, and the big end is provided with roller bearings. In the racing engine there are two exhaust and one inlet valve, but there are only single valves in the ordinary touring engine.

The radiating fins, as are also the inlet and exhaust passages, are of generous size, and the valves are large. Externally the engine is of clean design, and the crank case halves are fastened by six bolts of equal size, and equally spaced. The timing gear case is circular in shape, and is concentric with the crank case. Owing to the absence of outside bosses, it is smooth and neat in appearance. The makers hope to be in a position to deliver engines in quantities early in February, and we learn that they are being rapidly booked up.

The Motor Cycling Club's Dinner.

A Revival of an Important Pre-war Club Meeting.

THE Motor Cycling Club's annual dinner was held at Gatti's Restaurant on Saturday evening last under the chairmanship of Lt.-Col. Chas. Jarrott, O.B.E., the president of the club.

After proposing the health of the King, the Chairman rose to propose the Motor Cycling Club. It was, he said, difficult to realise that the last dinner that the Club had held was in 1913, so much had happened in between. Many members then present were no longer in their places. Many had joined up at the outbreak of hostilities. Efficiency was the tradition of the Motor Cycling Club, and, owing to the training they had received in the Club competitions, they had done extraordinarily good work as despatch riders. The war had helped enormously to develop the motor cycle; it had increased production, and many present riders of motor cycles would never have been motor cyclists had it not been for the war. When the country was short of men, women motor cyclists had stepped into the breach, and had done their duty nobly. He believed that the R.A.F. was first to employ ladies as motor cyclists to any extent.

A Tribute.

He had already referred to absent friends. Among these he would like to mention that splendid sportsman and gallant officer, the late Rear Admiral Sir R. K. Arbuthnot, who had always taken such an interest in the Club. One had only to read the books recently written by Lords Jellicoe and Fisher to learn how much his services were appreciated in the Navy, and he thought it a great compliment to the Club that Sir Robert had taken such a keen interest in it.

The Club was fortunate in having a very efficient secretary, and he had pleasure in presenting, on behalf of the members, a small token of appreciation to Mr. Southcomb May for his valuable work (this took the form of a fitted luncheon basket). Mr. May, in response, gave a few figures concerning the Club's competitions, and mentioned that the Exeter Run had already received over 100 entries.

The next item on the programme was the distribution of prizes, which was carried out by the president. After distributing medals won in the London-Edinburgh and other competitions, the President handed to Mr. Victor Holroyd (representing the Coventry and Warwickshire Motor Club) *The Motor Cycle* challenge cup for the M.C.C. Team Trial. On being called upon for a speech, Mr. Holroyd said that it was nine years ago since he had performed a similar pleasant duty in London at the occasion of the M.C.C. dinner. Next year he considered that the competition should be held in the district in which the winning club was situated.

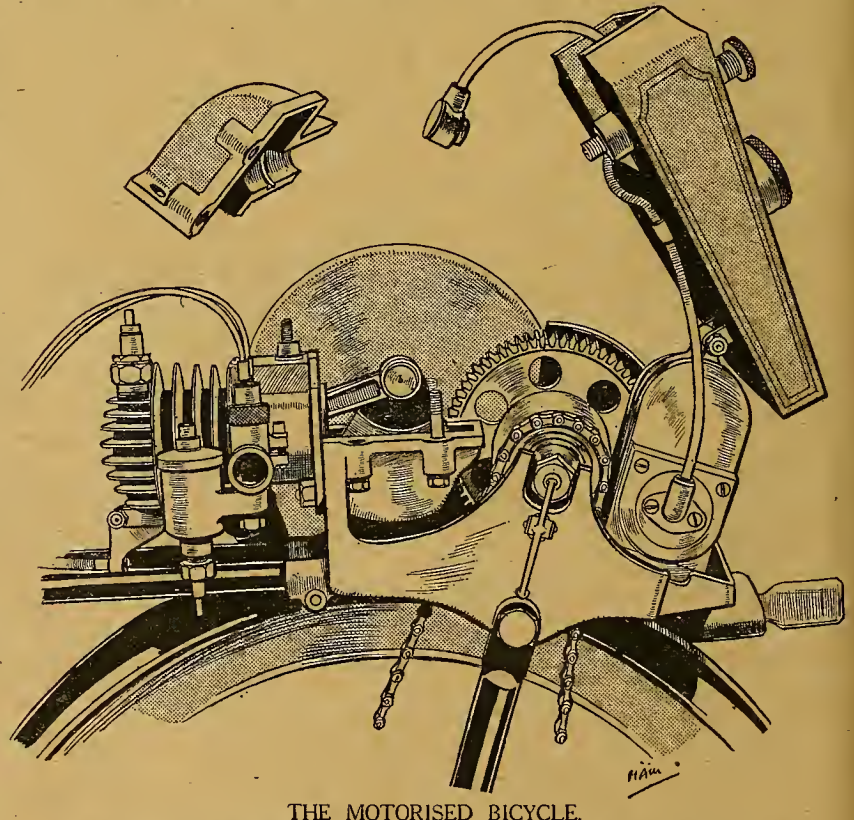
A 1914 Prize.

Silver medals were then presented to Capt. Norman Longfield, representing the Ilkley and District M.C.C., which was second in the competition.

The next prize to be presented was the Jarrott Cup, competed for in 1914, and won by Mr. E. A. Colliver, who, being called upon, made a brief and suitable speech.

The toast of "The Visitors and Press" was by Mr. Arthur Candler, mentioning Mr. Rutter in connection with the press, and Mr. Holroyd in connection with the visitors, to which both these gentlemen suitably replied.

The last toast of the evening was that of "The Chairman of the Committee," Mr. Robert Head, proposed by Mr. E. M. P. Boileau *(The Motor Cycle)*. Mr. Head, in the course of his reply, said that his friend, Mr. Arthur Mescheni had stated that the Lugano Cup was still open. This, it may be remembered, was to have been competed for in 1914, and was in the nature of a trial from London to Lugano, Switzerland, and should prove an interesting event.



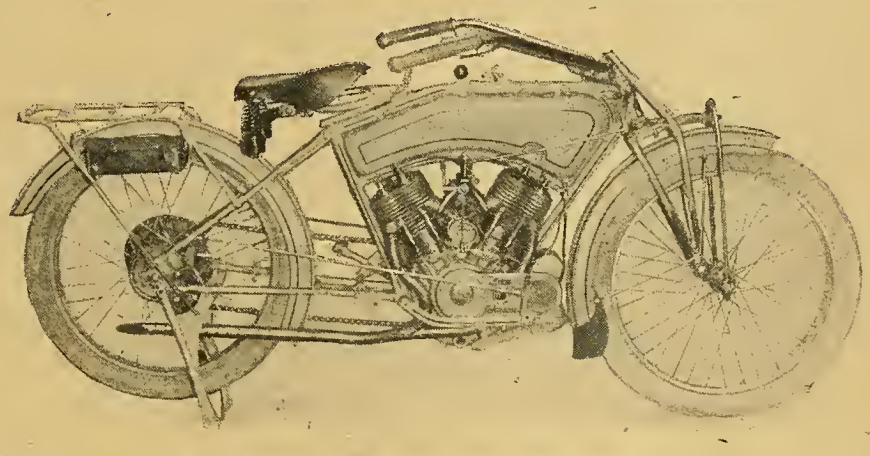
THE MOTORISED BICYCLE.

Accessibility of the Simplex motor attachment is one of its striking features. On swinging back the petrol tank the top half of the crank chamber can be removed.

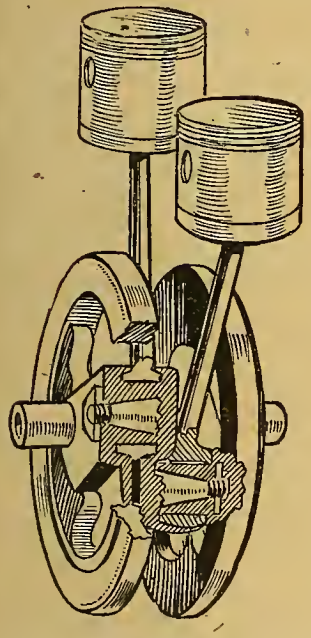
The 7-8 h.p. Twin-cylinder Iver-Johnson.

Side-by-side Valve Even Firing V Twin Engine, with Two-throw Crankshaft.

FEW English motor cyclists have heard of the Iver-Johnson motor cycle, which hails from the United States, and it was the original intention of a British firm to place it on the English market. However, the manufacturers are unable to deliver, and the one example in this country is to be sold, so the make will not be on the market here for some considerable time. It presents, however, several interesting features, for which reason it cannot fail to interest our readers, and we propose to give a brief description of it.



A powerful American machine little known in this country.



Two-throw crankshaft of the 7-8 h.p. Iver-Johnson V-twin, which permits even firing.

In general, the machine leaves much to be desired by the English rider. The handle-bars are narrow, while the transmission is by long single chain. The engine, however, possesses several good points. It has a bore and stroke of $3\frac{1}{4} \times 3\frac{3}{4}$in. ($82\frac{1}{2} \times 95\frac{1}{4}$ mm.) respectively, and is provided with particularly wide plain bearings. The crank is made from a drop forging telescoped in sections, which are keyed, locked, and double riveted. The crank sections are recessed to allow of wide efficient main and connecting rod bearings. The double crank is contrary to usual motor cycle practice, and its construction allows one piston to finish the exhaust stroke at the exact moment when the other piston is completing its compression stroke, consequently the firing is even.

It may be recalled that a V twin engine manufactured by Messrs. Alldays and Onions embodied a similar double throw crank pin to obtain even firing.

The timing gear is also a distinct departure from the ordinary. The small timing wheel rotates inside an internally toothed ring, on the outside of which are the cams which actuate rollers on the base of the valve tappets. The method of driving the oil pump is also ingenious. The pump is a plunger with a cone rotated in the socket by a ratchet operated from the inlet tappet of the front cylinder. The spring-actuated plunger within the cone is withdrawn by a cam surrounding the plunger, and when it slides off the cam the spring drives the plunger down and discharges the oil directly into the crank case. The amount of oil delivered is also capable of adjustment.

Under-geared Transmission.

An epicyclic reduction gear on the engine-shaft embodies a clutch, and a two-speed hub can be fitted at an extra charge. A kick-starter is provided, but this, as in many other American machines, is on the near side.

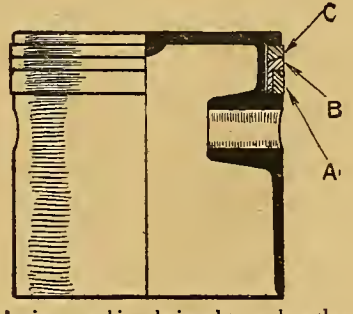
The American manufacturers are the Iver-Johnson Arms and Cycle Works, Massachusetts.

Piston Packing.

A Substitute for Conventional Piston Rings.

THE piston packing shown herewith has been devised by Mr. F. Shutler, 98, Northfield Road, Coventry, to take the place of the usual piston rings. He describes it as follows:

The packing consists of three split spring rings, which assemble in a single groove. The ring A is a plain piston ring, but is carried on a sleeve ring B, so that their joints when broken are sealed to gas; then, if an axial pressure is maintained in the groove, so that gas is prevented from escaping from the bottom of the groove up the front side, a perfect gas joint is obtained. This axial pressure is obtained by means of a bevel on ring B engaging with bevel face on ring C. This ring C is also so arranged that a proportion of the pressure behind the piston is admitted under the ring B, and also under itself (C). This results



A piston packing designed to replace the usual rings.

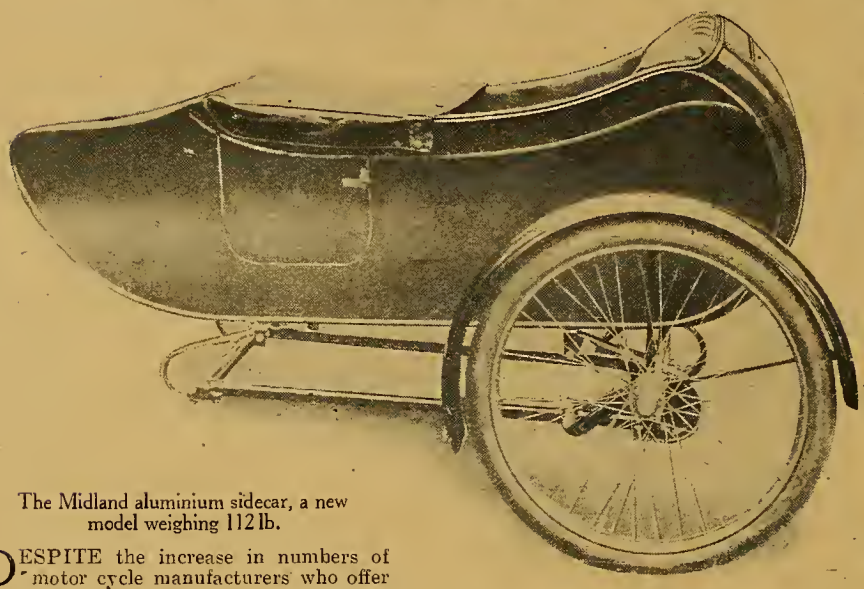
in an added radial pressure when compressing and firing, and also an added axial pressure, both being necessary when the pressure behind the piston is increased.

We are informed that it has been fitted to a number of engines, and is giving excellent results. On test, it is claimed, it gives constant compression, and, of course, all that this implies. The inventor tells us that experiments have shown that with the engine choked with oil it is impossible to get a smoke trail, even when additional oil is then forced into the crank case. Nothing more than a film of oil, sufficient for lubrication, is allowed to get on to the cylinder walls. Thus a whole list of defects, due to the present system of packings, is said to be eliminated. Further, a saving of quite 33% is claimed on fuel consumption.

These are the principal features of a simple device, which is easily fitted, and which should be quite reliable.

An Aluminium Sidecar Body.

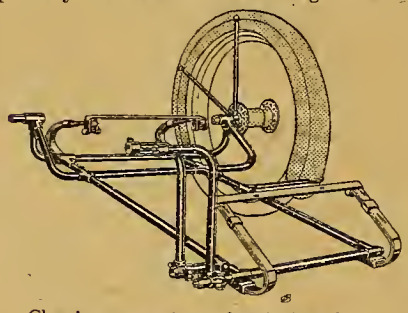
The Midland Sidecar. A New Attachment with Novel Springing.



The Midland aluminium sidecar, a new model weighing 112 lb.

DESPITE the increase in numbers of motor cycle manufacturers who offer their machines complete with sidecar, passenger attachments as a separate proposition are attracting a large number of new firms who have suitable facilities.

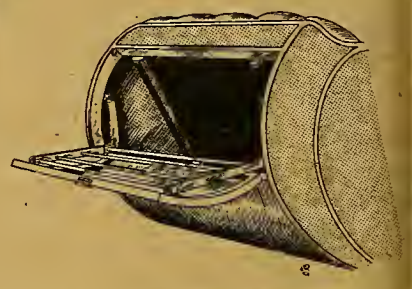
One of the latest additions to the "proprietary" sidecar manufacturing firms is the Midland Sidecar and Light Body Co., of Stratford Street, Upper Stoke, Coventry, who for some time have built a large number of bodies for motor cycle manufacturers. In deciding to introduce a model of their own, however, those responsible had the good sense to realise that the production of a complete sidecar was a matter more serious than a mere question of placing their body upon standard type chassis. They are body specialists, and they decided to work in conjunction with another firm specialising in sidecar chassis. This firm is the Ball Pedal Co., of Byron Street, Coventry, a concern which has produced chassis of special design for the trade for several years, and the combined effort is a splendidly made, well-designed, and comparatively light attachment.



Chassis construction and springing of the Midland sidecar.

The "chassis" is rectangular, and is dropped below the wheel centre in a manner which is made quite clear in the illustration. From each end of the two longitudinal members the four laminated springs are extended. At the far end these springs fit into a box formed integral with the T lugs of the frame, and are secured by a single bolt at their rear end. The springs approximate to a U shape, doubling back to support the front end of the body. Of similar design, the rear springs are shackled to the body. Four-point attachment, a detachable wheel, and a well-stayed guard, form part of the specification.

Turning to the body, we were struck by the particularly good quality of the workmanship and finish. The panelling is of aluminium on laminated corner pillars; the majority of the beads are swaged in the metal. The upholstery is of Crochett's first quality American cloth very closely resembling leather, and the seat and back cushions are deep and well sprung. At the rear of the body there is a fair sized locker, the lid of which is fitted with a small grid enabling it to be used for the carriage of a suit case.



The grid of the Midland sidecar forms the locker lid.

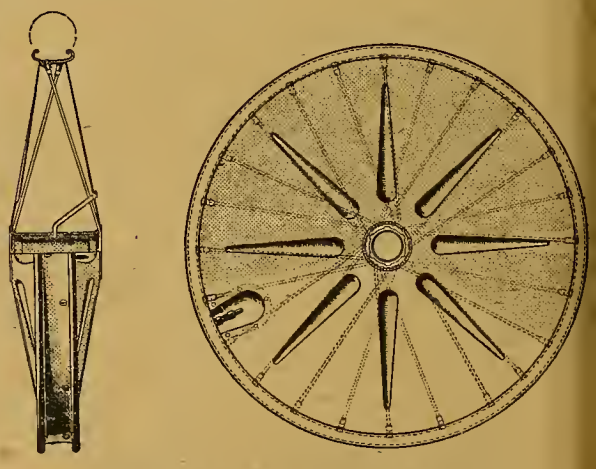
The standard colour is a rich dark blue, but an all-aluminium finish may be obtained if desired at the same price, *i.e.*, 32 guineas, which includes an apron, but the grid and quick detachable fittings are extras.

A COMPOSITE DISC AND WIRE WHEEL.

WITH the idea of producing a type of wheel which would be relatively inexpensive to manufacture, and embody the advantages of both disc and wire wheel, Mr. Norman Ryecroft, of Coventry, recently designed and patented the composite wheel illustrated below. It will be seen that the wheel has a rim of the voiturette type, against which are fitted two light pressed steel discs with inwardly flanged edges at their peripheries, and which abut against each other at this point, forming a seating for the rim.

The hub consists of a shell, having six splines milled upon the outside, which carries two flanged sleeves with corresponding splines fitting friction-tight on each end of the hub. By this construction the flanged lower edges of the discs are placed inside the hub flanges. A minimum number of spokes are used, and these extend from the flanges of the hub sleeves through holes around the central hole of the adjacent disc across the middle plane of the wheel and through the peripheral flange of the other disc. In this way the spoke tension tends to draw the discs together, so that they can share the driving strain with the spokes.

It will be observed that, while the spokes hold the rim in compression, all road shocks are absorbed by the discs, which are also held in compression. Thus this construction provides a certain amount of resilience which is present in a wire wheel, but which is absent in the disc type.



Details of the Ryecroft disc wheel construction.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

MUDGUARDING.

Sir,—We have read with interest your leading article on passenger machines in the issue of *The Motor Cycle* for November 13th.

Your last paragraph says: "Mudguarding, especially with regard to the front wheel, is still capable of improvement." We might say that our latest sidecar, in which the front portion has been raised in order to give a more streamline effect, shields the passenger admirably—more so than any improvement to the mudguard could have done.

RUDGE-WHITWORTH, LTD.

JET SIZES.

Sir,—May I be permitted, through the medium of your paper, to thank those of your readers who so kindly gave me advice in reply to my query of October 9th as to jet sizes for a 3½ h.p. Sunbeam combination with Amac carburetter?

I am glad to say I have found the solution of my troubles in N.B.A. benzole, which has enabled me to fit a jet three sizes smaller, reduce my running costs, lowered my consumption by about 25%, and at the same time gives me an extraordinary increase of power on hills. I am now an N.B.A. benzole enthusiast. C.T.

Shalford.

A MAGNETO TIP.

Sir,—Maybe the following may be of use to users of Thomson-Bennett magnetos. Recently I had the misfortune to have the carbon brush removed from my Triumph motor bicycle by some meddlesome person while I was away on holiday in the country.

Being some fifteen miles from the nearest repair shop or town, something had to be devised on the spot. On examination I found that in the brush holder there is a brass sleeve to contain the brush spring. By removing the rubber washer the brush holder will fit "home," and enable the brass sleeve just to bear on the armature. I was thus able not only to ride home, but also to complete 300 miles before fitting a new brush, and during the whole time I never had a misfire. By the way, a local repairer charged me 3s. for a new brush, which strikes me as distinctly like profiteering. A. RIDER.

Dublin.

THE VALUE OF THE AUTOMOBILE ASSOCIATIONS.

Sir,—As many motor cyclists seem doubtful of the advantages offered by joining the A.A., may I relate the following incident? When stationed at Portsmouth I ordered a well-known make of motor cycle in May, paying a deposit on the understanding that delivery would be late in June. Demobilised and settled in Glasgow, I wasted a glorious summer waiting for my mount. Reply prepaid telegrams and letters were sent and not replied to. Finally, in October, I obtained another make and joined the A.A. I brought the matter before the secretary, and, to my surprise and gratification, *within a week* I received deposit in full with letter of apology. EX R.N.O.

Liscard.

Sir,—I have read lately in the cycle press various comments on the A.C.U. scouts and get-you-home scheme.

I met with an accident on Saturday, August 30th, while travelling, with my wife in the sidecar. I overturned in avoiding collision with a car which came unexpectedly out of a narrow side road at Hoo Green, Knutsford. My wife and I were badly knocked about—my injuries consist of a broken collar bone, and two ribs. I was almost too much hurt to bother about any sort of scout, but an A.A. man quickly turned up and rendered what help he could, although I am a member of the A.C.U. However, after being attended to—I must say very kindly indeed by everyone at the "Hoo Green Hotel" (proprietor Mr. Power)—we proceeded to return to my home, nearly twenty miles away, by taxi.

Last week I wrote to the Secretary of the A.C.U. giving particulars of above, and, although the cost of the taxi was £2, I received a cheque for this amount almost by return of post. This action speaks for itself, and although I think that, perhaps, it would be an economical advantage for the scouts of both A.A. and A.C.U. to be amalgamated it is without doubt to the advantage of all motorists to be a member of both the A.C.U. and the A.A. K 1147.

St. Helens.

APPRECIATION.

Sir,—As a reader of *The Motor Cycle* from its initiation, I would like to congratulate you on the issues for November 13th and 20th. Those readers who cannot get to Olympia will appreciate the splendid descriptions of machines, and the many items of interest connected with the Show. Although I intend visiting the Show I would forego this pleasure rather than miss what *must* be the crowning success of your journal.

Motor cyclists cannot afford to be without *The Motor Cycle*. May I make one suggestion? Instead of the word "pastime" on your heading, would not "movement" be better? It is more than "pastime" to-day, and I am sure that many motor cyclists will agree that a motor cycle is an absolute necessity, for business and pleasure alike.

I was about to suggest the word "sport" instead of "pastime," but fear this would be inadequate. Perhaps some reader will suggest a word better than "movement."

S. BARKER.

[We are grateful to our correspondent for his suggestion and remarks. The former shall have our consideration. The word "movement" is already used on the cover.—ED.]

WATERPROOF CAPS.

Sir,—I see in your issue of October 23rd that "Ixion" complains of the inadequacy of the cap as a motor cycling head gear.

I suggest that he tries what is known as a "fishing hat," that is, if he has not already done so. This consists of a circular high-crowned hat with a brim about 2½in. wide all round it. The material should be Harris tweed or some heavy material of that kind. There is also a lining, of cloth in my case, but I would suggest that this could be made of ordinary macintosh if required. There is no stiffening material used, such as the cardboard in a cap brim.

I first tried this hat in 1911, and have always used it since. It is amazing how much wet it will turn before becoming sodden—in fact, with a water-proof lining it should never get wet through. The brim can be pulled down over the eyes to protect the goggles, and, while projecting far enough to prevent water running down the neck, it does not catch the wind and cause that tilting over the eyes that one experiences with a south-wester. Owing to the fact that the crown is dome-shaped, and therefore has a slight taper, the harder one pulls the hat on the harder it is to get it blown off, I do not think that this has happened to me more than once or twice.

This hat has been well tested, for I used to ride throughout the year in all kinds of weather on powerful machines,

and, though perhaps my description makes it sound somewhat unsightly, it is by no means as bad as some of the headgear one may observe almost any day on the road.

I have been out here since August, but have not got a machine, as the season is so nearly over and the roads are impassable in winter, and are bad even in summer.

While on the subject of clothes for motor cyclists, it may interest you to hear that the appearance of the average motor cyclist over here is infinitely worse than in England. It appears to be the fashion to wear rough clothes which are liberally smeared with oil; since no overalls are worn, one can see people come into hotels looking more like mechanics, and dirty ones at that, than anything else. This applies both to men and women. One continually hears remarks about the dirtiness of motor cycles, conveying the hint that those who ride them are not fit for decent society, not unlike it used to be in the good (or bad) old days. R. T. LEATHER.

Quebec, Canada.

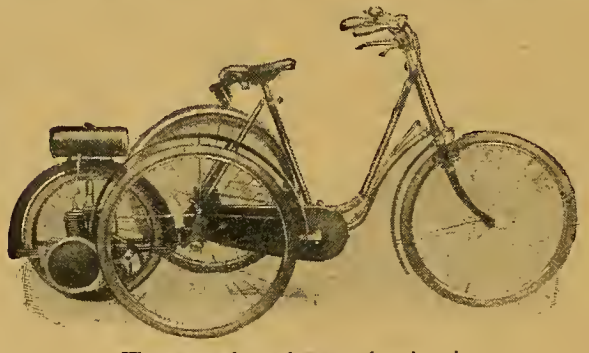
STRENUOUS RIDES.

Sir,—I notice that Captain Pike's ride from John-o'-Groat's to Land's End in five days seems to be considered a strenuous test for man and machine. I should like you to recall the fact that years ago G. P. Mills did the same journey in less time on a push tricycle. Surely the modern lightweight is a faster machine on a long journey than the old tricycle? H. WAYWELL.

[Lieut.-Colonel G. P. Mills's fine ride was not done in November or amid ice and snow.—ED.]

ATTACHMENTS FOR THE AUTO-WHEEL.

Sir,—My attention has been called to a statement in a recent number of *The Motor Cycle* that Messrs. Auto Wheels, Limited, were the inventors of an attachment for



The patented attachment referred to by Mr. Frank Hucklebridge.

fitting an Auto-wheel to a tricycle. This, however, is an error on your part. The attachment used by Messrs. Auto Wheels, Limited, is designed, patented, and made by myself, and I have pleasure in sending you a photograph showing the attachment.

FRANK HUCKLEBRIDGE.

KICK-STARTERS.

Sir,—I think the impression given by "'Ixion's" comments that there are no efficient kick-starters should be corrected. Personally, I have experience of two efficient types, *i.e.*, the Scott and the Triumph. Pre-war I had a Scott in constant use, winter and summer, using petrol or benzole, and I never had any difficulty in starting with the kick-starter. During fifty-three months as a D.R., the greater portion of which I used a countershaft Triumph, I could always start when, and how, I wanted to. I have been in four different countries and climates, and the spirit we used to get resembled paraffin, but if the machine did not start in two or three kicks I knew that the kick-starter was not the thing to be blamed.

The whole point is this, the average rider expects a mechanical fitting to do work which he himself would gibe at when the machine is not in tune. Keep the machine as fit as if you had to push, treat it in the proper manner when preparing to start, learn the knack, and you will always be able to start easily. It is not always a case of dropping the valve-lifter, a Triumph can be started in one kick without using this on the decompressor.

G. HAROLD DUNSTON.

TAPPET CLEARANCES.

Sir,—With reference to "B.S.A.'s" letter (November 20th) on the subject of tappet clearances, it has occurred to me that the following may be the correct explanation. When the engine is warmed up to the average running temperature, both the cylinder barrel and valves lengthen slightly owing to expansion, but as the former is considerably longer than the latter, it necessarily follows that the valve is, so to speak, lifted away from the tappet, owing to the lengthening of the cylinder barrel. When, however, the engine is run "all out," the temperature of the cylinder barrel does not increase to anything like the same extent as that of the—practically uncooled—exhaust valve, owing to the radiation of heat *via* the cooling fins, so the valve stem then lengthens to a greater extent than the cylinder barrel, and the tappet clearance diminishes. R. F. MANN.

TRAMS.

Sir,—As a keen motor cyclist, I feel I must say a few words of regret that the London County Council are proposing to extend their tramway service in various districts. Surely we motorists ought to have something to say against this. Every motorist who rides about the larger towns of this country has experienced great inconvenience caused by the tramcars in traffic. One more often than not cannot pass them, and they cannot make way for any other vehicle owing to the fact that they are tied by their lines.

If the L.C.C. must have trams, why cannot they use the system whereby overhead wires are used and the trams, modified of course, run on four wheels without lines, the same as an ordinary omnibus.

Cannot the A.C.U. or the A.A. take up this matter for us, and put forward objections when the time comes for the hearing of the proposals? J. L. JEFFREE.

Smethwick.

OVERHEAD V. SIDE-BY-SIDE VALVES.

Sir,—Undoubtedly the reason given by your correspondent Albert A. Graham for the present decline of the overhead valve arrangement is quite feasible, but does he carry his conclusions far enough? Continuing on the line of reasoning adopted by him, the following question obviously arises. Does the increased efficiency obtained from the improved shape of the overhead-valved combustion chamber effectively compensate for the greater strain in the timing gear induced by stronger valve springs and increased friction developed by the use of extra bearings? (Incidentally, it is quite obvious that extra strain on the timing gear can be compensated for in construction.) If it does *not* do so, why adopt this arrangement, even in racing models? If it *does* do so, why not adopt it in the touring model? The only reason, as far as I can make out, is that "the tourist wants to increase his reliability as much as possible." Certainly he does. Yet I can see no reason for the overhead arrangement being less reliable than the other. Surely it is only a matter of suitably constructing the parts, and securing the right quality of material. And I venture to suggest that the unreliability, if any, of the overhead arrangement is due to insufficient development, which perhaps, in its turn, is due simply to prejudice on the part of the buying public.

In this connection it is interesting to note the letter in your columns from the makers of the Duzmo engine, who, I think, should be commended for their attempt to prove the claims of the overhead arrangement in the best possible way, by incorporating it in a standard model. Incidentally, it would be interesting to know if the Duzmo combustion chamber is shaped as perfectly as regards thermal efficiency as is that of the new A.B.C. I have not seen a section of the Duzmo engine, but, judging by the position of the valve stems, as seen in the photographs of this engine, I doubt if it can be.

Albert A. Graham, incidentally, raises another interesting query: When will some enterprising designer produce a sleeve or cuff valve motor cycle engine? In the days when the single and V twin held the market, difficulties of balance killed any possibilities of using this type of valve. With the modern developments in design, surely these difficulties are no longer insurmountable. S. LATOUR HORDLE.

RISK OF FIRE.

Sir,—Lately I have suffered the painful experience of witnessing and hearing about a number of motor cycles which caught fire and have thus been materially spoilt before they could be extinguished.

Surely some enterprising firm will make a fire extinguisher or supply a carrier for one. Maybe someone else has views on this subject. RUDGE MULTIST.

MOTOR SCOOTERS.

Sir,—Just a word about motor scooters. Being a woman, I fail to see the use of such machines if they are for women to go shopping with. How are we to carry our parcels and packets? It strikes me it would take us all our time to hold on to the machine if the roads were at all rough. Can there not be something more suitable—say, an Auto-wheel fixed to a sidecar, or the works underneath, or just a small car to carry one lady. I think this would prove a great boon to middle-aged ladies.

J. C. PATRICK.

PETROL PRICES.

Sir,—It may interest those readers who grumble from time to time about the high prices of petrol prevalent at the present time to hear that we humble persons in this colony have to pay Rs. 38 a case of eight gallons, deducting a loss of one gallon in transport to Mbarara, which is undertaken on petrol lorries. The price per gallon at the present time works out at the colossal figure of over 7s. per gallon, and yet we are only too pleased to get the liquid at the price. C. C. FREEINE.

Mbarara, Uganda.

CHAIN CASES.

Sir,—I have noticed while reading the descriptions of new models appearing from time to time in your excellent paper that in the case of all-chain-driven machines there is a tendency to leave the rear chain open or else to provide it with a meagre guard. I suppose the reason for this is accessibility. But surely a totally enclosed chain will last much longer without attention than one running in mud and wet? The Sunbeam oil bath transmission is as near perfect as one could wish for. There is not a sign of rattle from the chain cases, and the chain itself is kept adequately lubricated and in beautiful condition. I fully realise that chain cases are hard to perfect, but it is surely rather cowardly to omit them altogether. The case of the new Premier Runabout seems neat and accessible. The sidecar, of course, makes the average chain case hard to get at, but the Sunbeam people have solved the problem by taking the chain down the right-hand side of the machine.

These remarks apply only to the rear chain in the case of heavyweights, though I think the front chain in many lightweights might be provided with a case. The 1920 New Hudson sets a good example here. I consider this non-enclosing of the chain one of the few weak points in the design of the A.B.C. A.H.S.

Enfield.

THE PASSENGER OUTLOOK FOR 1920.

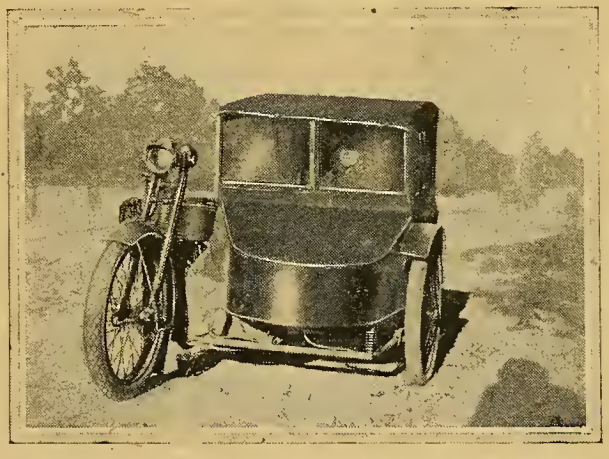
Sir,—Mr. Davies's article in your number of November 13th is of exceptional interest, both to the manufacturer and to the public. His final recommendation—"massed production of runabouts"—concerns us very closely. Perhaps we may be allowed to say something on this point, for we entirely agree with the article in question. Mr. H. Ford (who ought to know) is reported to have said that an output of 10,000 cars per annum secures the utmost economy of production. The "correct counterblast," therefore, to the threat of the competition of the cheap light car is a production of at least 10,000 runabouts. Now it is scarcely doubtful that more than that number of orders could be secured at the Show alone for a popular machine. Yet we must admit that we are booking only a limited number of orders, much to the discontent of our agents, who are promised tens where they are asking hundreds. What is the reason? Simply the impossibility of, largely increased production under present circumstances. We cannot secure the necessary parts. If we gave an order, let us say, for 10,000 engines, it is very unlikely that they would be delivered. If we could get twenty a week from one well-known English manufacturer at the present time we should be delighted. Why not then make our own engines? Is it likely that within the next twelve months we could accomplish what old-established firms are unable to promise? It is the same in regard to other things. Given the materials, and we have the means of mass production, but they are not given and cannot be obtained. There are therefore two courses open to us, either to make promises which it is very unlikely that we should be able to fulfil, or to limit our acceptance of orders and trust to increase our output under better conditions, even though we know that this limit increases the cost of production.

But the strength of the light car competition depends on whether the producers are more fortunate in this respect than ourselves. Light cars, some of which have never yet been on the road, and most of which at present exist in twos and threes, *may* be able to secure what we have found unprocurable. But unless they can do this, and do it before the older firms are in a better position, the competition will be negligible. We fancy that before that time the "correct counterblast," of which your contributor speaks, will be in full operation. MORGAN MOTOR CO., LTD.

THE "WHAT IS IT."

Sir,—The inventor sometimes thinks that he knows, and sometimes the spectator has a say. "Oh! what is it?"

It has no particular shape. It is absolutely weatherproof. Seats two with comfort. The seat back is detachable, and forms part of a mattress for sleeping on. The space behind the seat holds 60 lb. of luggage. The space in front beyond our feet holds another 40 lb. We have travelled 800 miles and slept in it ten times. It can be driven hands off on a level road. The body has no side next the machine. The box for the driver's feet is unsprung and has flexible canvas sides, the rest of the body being sprung. The hood is detachable, but we always leave it up on account of the dense clouds of dust on our Sydney bush tracks.



PROTECTION FROM THE ELEMENTS AT A COST.

A two-seater sidecar, with interior steering and controls, referred to by our correspondent, Mr. Louis Russell.

Ingredients? Yes! One Harley-Davidson, £115; chassis and alteration, £38; body material, etc., £15 (body home-made). Take the Harley-Davidson, strip handles, footrests, front stand, clutch, foot mechanism, carrier, seat, and seat-pillar. Change the foot brake to the opposite side and well forward, work the ignition control by a small lever near the magneto. Connect the chassis, put the body on, fill in spaces with canvas, allowing for springing motion, fill the tank, put in fishing rod, bait lines, enough food for four meals, pillows, blanket and sundries, leave home at 1.30 p.m. on Saturday, over the hills to the favourite spot, back again Sunday evening or Monday morning. Petrol, 35 m.p.g.

Hills? Climb anything up to 1 in 3 so far.

If any manufacturer cares for the design let him wire in, as it is fully unpatented. We cannot manufacture here on account of high wages.

In conclusion, let me say that the outfit is satisfactory in every respect, and has been tested on the roughest tracks imaginable. We have solved the problem.

Sydney. LOUIS RUSSELL.

SPARE PARTS.

Sir,—I should be very pleased if you could find space to publish this letter in your most interesting paper.

I have a motor cycle fitted with a Jardine four-speed gear box, and was unlucky enough to break the belt pulley. After failing to obtain a new one locally, I sent an express letter to the makers, asking the price of the pulley. One can guess my surprise when I received a new pulley two days later by express post.

I have no connection with this firm except as a satisfied owner of one of its gear boxes. SATISFIED.

Southampton.

Sir,—I have been much interested in the letters appearing in *The Motor Cycle*, giving examples of good treatment from certain firms in supplying spares. I am afraid I am one of the customers whom "Lieutenant, R.N.," in your issue of November 13th, describes as those treated indifferently. Two months ago I bought a new lightweight from the local agent. I had not run the machine 100 miles before the magneto gave out. I returned the machine to the agent, who dismantled the magneto and found it faulty, and immediately despatched it to the makers of the machine. This firm acknowledged receipt of it, and said they had sent it to the manufacturers. After three weeks, having no news of the magneto, the agent wrote to the magneto manufacturers. In reply, they stated that from the description the magneto was evidently faulty, and that they would replace it as soon as it was received. Apparently it had never been sent on to them. Repeated letters and a telegram have brought forth no reply from the makers of the motor cycle, and I am still without my machine.

As you publish, and quite rightly, appreciations, I should be very much obliged if you will publish this, as such a display of negligence should be shown up.

B. W. ROBINSON.

Sir,—After all the laudatory epistles from readers regarding the fair dealing, etc., of various firms, I should like to point out that the other side of the picture should be given equal prominence.

I own a 2¾ h.p. twin, and have ridden it four times. The first time the chain broke. Second time: Bolts holding the magneto to the crank case stripped the thread in aluminium. To cure this fault, I had to put a steel band right over the magneto, the ends of the steel band fixed under the plugs each side of the case. Third time: The magneto timing wheel stripped its teeth, the flywheel became slack, and the engine loose in the frame. Fourth time: The main timing wheel teeth all came off, causing the following: Intermediate wheel stud and wheel useless, magneto pinion again stripped its teeth, and, worse than all, bent the armature-shaft. Lower down the cam wheel was absolutely spoilt by the damage to the main pinion. Inside the engine both connecting rods were bent.

All this trouble is directly traceable to faulty material and bad case hardening.

The mere replacement of parts by this firm (or any firm for that matter) can never compensate for the trouble and inconvenience caused by faulty parts. Good steel can be obtained, proper hardening of parts can be done, and there is no excuse except that of "getting rich quickly," for the sake of inferior material or slackness in examination of parts. Firms who carry on in this manner with the general public will get a very rude shock in the near future when conditions become more normal. ALBERT V. HUGHES.

THE LIGHTING REGULATIONS.

Sir,—There is, I am afraid, an entire absence of logic in both the letters written by "Sivel." In the "deliberate misquotations" imputed to "Iorwarth," the difference is in *words* only; the sense is in no way changed, nor does a suggestion that one class has some sense necessarily impute lack of sense to another class, although it may do so. For suggestions that cyclists have no sense I would refer "Sivel" to the cycling press, where he will find it stated that the lighting regulations are too complicated for them to understand, and also to the fact that they often display red lights in front and white lights behind. It is a poor cause that necessitates such bolstering.

"Sivel" says (I must be careful to get the quotation exact): "I have, myself, on numerous occasions escaped by a hair's-breadth being smashed up by passing motorists at night—in spite of my rear lamp!" How does he know that his escapes have not been entirely due to the presence of his light? It is absurd to suppose that because accidents have unfortunately happened when rear lights have been carried that they are of no use. Running down cases have happened in daylight, but does anyone suggest that daylight is insufficient to give satisfactory vision? I have myself had a few narrow escapes from running down cyclists, in each case because of the unexpected antics of the cyclists themselves.

"Sivel's" letters make me wonder whether he has done much night riding away from North London. In the country it is largely the bright lights of cars that make it so difficult to see unlighted cycles, and it is the presence of unlighted cycles that makes these blinding lights necessary. Here we meet with a vicious circle. In meeting these blinding lights one seems to ride into pitch darkness, but a red light is quite visible. Therefore I entirely agree with the statement of "M 5229" that "there can be no doubt of the advantages of the rear lamp." Many rear lamps are perfectly reliable.

I hold no brief for the road hog, and do not approve of his methods, being myself a careful rider, but I have to do more night riding than I like. JOHN HOLLAND.

Sir,—With reference to the letters of Isaac Bartu and "Sivel" in your issue of November 6th, 1919, may I be permitted to disagree entirely with them as regards the rear light for cyclists?

I ride a 3½ h.p. combination home every night from Whitehall to Richmond, and as I go *via* Kensington High Street, Hammersmith, Barnes Common, and Sheen, I get a "little of all sorts," as far as traffic and road lighting are concerned. I am not a "speed merchant," and my experiences are not due to "hogging it." Further, my eyesight is perfectly normal, and my head lamp an exceedingly good one.

I have been astonished at the difficulty I find in seeing cyclists on these dark nights, unless they carry a rear light, especially if they are riding astern of some well-lit vehicle (such as a motor 'bus), which seems to accentuate the gloom behind it, and on several occasions I have found myself nearly on top of a pedal cyclist before my lamp chanced to show him up. The huge glare from some cars, whose owners insist on using head lamps of the searchlight variety, increases the difficulty, as for some few seconds after they have passed nothing unlit can possibly be seen.

Of course, if the cyclist happens to come within the direct ray of my head light, that is another matter, but I, for one, am convinced of my own experience that, near London at any rate, rear lamps for cyclists conduce greatly to their safety. Even the red glass astern by itself is useful, as one's light picks it up at a distance when the cycle itself is not visible.

I find pedestrians equally hard to see, but the sensible pedestrian faces the oncoming traffic, and looks after himself when crossing the road. The cyclist, on the other hand, has his back to overtaking traffic, and, to my mind, the two cases are not analogous, any more than are the other "impedimenta" mentioned by "Sivel." C. TYERS.

BOOKS AND MAPS FOR MOTOR CYCLISTS.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Timing with Fixed Ignition.

Could you let me know the correct ignition timing (in millimetres, of stroke—also degrees) for a 1914 or 1915 Precision Junior 2 h.p. engine, with fixed ignition?—D.H.M.S.

The spark should occur 6 mm. from the top of the compression stroke, or 20° in advance of top dead centre.

Misfiring on One Cylinder.

Will you kindly tell me if the W.S.R. variable jet adapter would give me the improvement the makers state. My machine is a 1914 6 h.p. Enfield fitted with an Amac carburetter, and I find in throttling down to run slowly that it only runs on one cylinder.—J.W.S.

The W.S.R. jet adapter is quite a satisfactory article and fully meets the object for which it was designed. It is doubtful whether its use would eliminate the particular fault to which you refer. It would appear that either there is an air leak in the induction system of the offending cylinder or else that the plug is unsatisfactory.

A Dynamo Lighting Arrangement.

I have one of the C.A.V. hand-starting magnetos. By removing the contact breaker and connecting a small four-volt bulb to the primary winding I can light it brightly by turning the magneto by the handle. I intend to replace the handle by a pulley, which will be geared 5 to 1, to the armature. (1.) About what speed should the armature be run to obtain the maximum primary current? (2.) I want to light one head lamp and a rear lamp. (3.) My machine is a standard 3½ h.p. Rudge-Multi. Can you suggest a means of fitting a pulley to the engine to run the magneto as a dynamo? All rotating parts of the Rudge engine are well enclosed, which adds to the difficulty of fitting a pulley.—A.U.

(1 and 2.) Possibly you can use the C.A.V. magneto as a light generator, as you suggest. We should think, however, that you will find some difficulty in keeping the bulbs in order owing to the continual variations of voltage. The maximum primary current will be obtained at about 1,500 r.p.m., and will probably amount to about twenty-four volts. It will be necessary to include a choking coil in the circuit, so that you can use four-volt bulbs. (3.) We do not think that the 3½ h.p. Rudge engine lends itself to the incorporation of a dynamo drive, as there are no convenient rotating parts exposed.

Fitting a Kick Starter.

I wish to fix a "kick start" to the off side of a 1912 Triumph engine, and shall be obliged if you will kindly advise me if it is possible to utilise the rear pinion of the timing gear?—H.K.L.

We should not recommend the fitting of a kick starter on the lines you suggest. The Triumph timing gear is not designed for this purpose, and would, in all probability, develop trouble.

Cattle on the Road.

I should be glad if you would inform me on the following: I was travelling between 12 and 14 m.p.h. up a long hill, all lamps alight, on the correct side of the road, when I crashed into a drove of horses. There were seven altogether. The first thing I saw was three or four of them—some on the grass and some on the (my) left side of the road. I wrenched the machine across the road to avoid those I saw, but crashed into the remainder. We completely overturned, but, luckily, were not badly hurt. The sidecar body is beyond repair. I have an estimate for a new one (£23), and more expense straightening the chassis. The cycle is undamaged. I had sold the turnout the same afternoon the accident occurred, intending to deliver it on my return from this journey. Of course, I could not complete my contract. I am also out of pocket by the expense in getting the machine home again. It appears that one employee of the owner of the horses had released them from the stable and was following on behind, while another was waiting at the gate of the field to turn them in when they arrived. The distance between would be about 300 yards. I have a witness who was standing about fifty yards ahead of where we crashed, who says the horses were trotting when they passed him, and he remarked to his friend at the time, "There would be a smash." The horses were loose, not roped. The road is about 20ft. wide. It was a misty night, and I could see absolutely nothing until they were on top of me. Is it lawful to drive loose horses along a main highway at night? Are horses classed as cattle under the Lighting Act? Is the owner liable for the damage and other losses? There was quite a lot of motor traffic on the road, owing to the railway strike.—J.A.B.

It seems to us that you have a good claim for damages against the owner of the horses on account of his employee neglecting properly to control the horses while on the highway, under circumstances which could not excuse him from such liability. It is laid down that if anybody by his own act, or that of someone for whom he is responsible, causes any animal, though not of a savage disposition, to go on to the highway unattended, under circumstances which result in damage being done, he is liable for the damage. A recent case confirming this is that of Turner *v.* Coates decided in 1917. A boy was leading an old mare who was followed by a colt which was accustomed to the mare, the owner coming behind driving a cart to prevent the colt from running back. A cyclist approached, and the colt, startled by the lamp, knocked the cycle over and injured the plaintiff, and it was held that the owner of the colt must pay damages. You would not succeed if the court was of opinion that you yourself were going too fast having regard to the fact that it was after dark. We are not aware that the owner is guilty of an offence with regard to not having any light. There was such a regulation in force during the war, but it was revoked early this year.

Cast Iron Valves.

I should be pleased if you could settle a little dispute between a friend and myself on the question of steel and cast iron valves. He maintains that a cast iron valve is far superior to a steel valve. On the other hand, I hold that such is not the case, and maintain that a steel valve is better suited on account of the seating not pitting so easily and the stem not so prone to break. Further, I claim that my case is proved by the fact that cast iron valves have been tried, have failed, and been discarded.—NOVICE.

Your friend is correct in maintaining that cast iron is superior to ordinary steel as a valve material. The chief trouble in the employment of cast iron, however, is that it is impossible to make the stem of the same material, and when a steel stem is screwed into a cast iron head there is always considerable danger of its breaking away at the end of the threaded part. You will get conclusive proof that cast iron valve seatings do not burn as rapidly as steel ones when you consider the fact that the seating in the cylinder is usually far less affected by prolonged use than the seating of the valve itself, which in almost all cases is made of steel, but, of course, it is far less hot than the valve. The best valves are made of tungsten steel.

Various Questions.

(1.) What principle is employed in the J.A.P. system of lubrication? (2.) Are any firms likely to market a 3½ h.p. or 4 h.p. four-stroke water-cooled motor cycle? —F.K.P. (India).

(1.) The J.A.P. system of lubrication depends upon the effect of the partial vacuum created in the crank case. Advantage is taken of the existence of this vacuum to induce a continual drip of oil from the tank through an adjustable sight feed lubricator. Oil is drawn into a box on the side of the crank case, whence it passes to the main shaft (timing side) bearing, and it is then led along suitably drilled oilways by centrifugal force to the big end. (2.) We do not know of any firms who are contemplating the regular manufacture of four-stroke water-cooled 3½ h.p. motor cycles, or who are likely to do so, since air cooling is now so efficient that water-cooling is unnecessary.

Completing a Purchase.

Will you kindly inform me on the following points? I sold a second-hand machine, and just before the purchaser left he noticed a scratch in the enamel on the head lug. I scraped away the enamel, and found the frame had been repaired. He seemed satisfied, however, and took it away. After ten miles the bad roads caused the repair to break, and, consequently, I offered to fit, free of charge, another frame which is quite sound. The purchaser said that if the machine (fitted with the sound frame) ran all right he would accept it. Instead of coming to test the machine he now asks for his money back. I maintain that I cannot refund the money, especially as I have gone to the trouble of fitting him a sound frame. I believe I was not liable even to do this, as he was shown the repair in the first instance, and was satisfied. I consider I acted generously, and think he has no claim for the return of the money. Am I correct in this opinion? —H.L.M.

In the case of the motor cycle you describe, we think that you treated your customer quite fairly with regard to the replacement of the frame, and, in consequence, you are justified in holding him to his agreement.

Broken Spokes.

I have a 1916 A.J.S. 6 h.p. motor cycle and sidecar, which has been giving a lot of trouble in that it is continually breaking the spokes in the rear wheel; but the curious thing is that it seldom breaks the outer ring of spokes, but smashes the inner ring by the dozen. Why is this? Can it be that the transmission is too rigid? I think the slipping device on the sprocket is working quite properly. I should be very much obliged if you could help me by suggesting any reason. The previous owner had a lot of trouble with the sidecar spokes which often pulled through.—J.S.C.

Spoke breakages in the driving wheel of the A.J.S. motor cycle are not particularly common, and we think the cause is most probably due to your method of driving. You should guard against running the engine on top gear at extremely low speeds, as this puts a great strain on both transmission and wheels. Sudden gear changes and violent braking also have the same effect. Maybe the spring drive could be slacked off somewhat, and this would soften the drive considerably.

READERS' REPLIES.

Blacking Cylinders.

On October 30th, one of your readers asked if anyone could tell him of a good cylinder black, as he had tried several so-called cylinder blacks which were not satisfactory. I was in the same fix until I saw Rosco cylinder black, supplied by Owen Bros., Hull, advertised in *The Motor Cycle*. I sent for a 1s. 6d. tin and was delighted with the results. It made my cylinders like new, and it thoroughly withstands heat. It can also be used to give an oxidised appearance to hubs, lamps, etc., as it is also rust-proof. I hope this experience will prove useful to other readers, who have not been able to get a satisfactory cylinder black.—JACK HENSON.

With reference to "R.N.B.'s" enquiry regarding blacking cylinders. I have found a paint composed of boiled linseed oil and graphite to answer excellently for my single-cylinder B.S.A. It remains perfect from one decarbonising to another, except round the exhaust port, and even this can be kept free from rust by giving two or three coats and allowing plenty of time for drying between each.—E. E. OLDERSHAW.

Irregular Firing of Two-stroke.

In reference to the question in the November 20th issue of *The Motor Cycle* by "S.A.J.S.," who has trouble with the firing of his two-stroke. I have had the same trouble on my own machine, and suggest that he should inspect the sprocket wheel screw of his magneto to make certain that the timing does not slip, thus causing the engine to fire irregularly.—D.E.

Starting Difficulties.

Probably the following tips for starting a B.S.A. 4½ h.p. may be useful to some of your readers, particularly "J.J.H.B.," Sierra Leone. Open the throttle about half way, and almost close the air. If everything is in order the engine should fire with the ignition lever in any position. In order to avoid back-firing, I usually start with the ignition well retarded. Open the adjustable jet to its fullest extent for a second or so, then close it down to normal position (about three-quarters or one turn open); this floods the carburetter. Give the engine one or two turns round with the exhaust valve lifted, and the gear lever in the low speed position. Now work the kick-starter until compression is felt, lift the exhaust valve, give the kick-starter a vigorous push, and immediately release the exhaust valve, when the engine will fire. By this method I can always start with the second kick without priming, on frosty mornings after the engine has been standing several days.—CHESHIRE CAT.

RECOMMENDED ROUTES.

WEYMOUTH TO LEICESTER.—I.M.

Weymouth, Dorchester, Blandford, Salisbury, Amesbury, Pewsey, Marlborough, Hungerford, Wantage, Abingdon, Oxford, Banbury, Daventry, Rugby, Lutterworth, Leicester.

SOUTHAMPTON TO CANTERBURY. — R.S. (I.W.).

Southampton, Fareham, Havant, Chichester, Petworth, Billingshurst, Horsham, Crawley, East Grinstead, Tunbridge Wells, Pembury, Maidstone, Charing, Canterbury. Approximately 140 miles

LIVERPOOL TO WEST HARTLEPOOL (DURHAM).—E.G.D.

Liverpool, Ormskirk, Preston, Garstang, Lancaster, Kirkby Lonsdale, Sedbergh, Kirkby Stephen, Bowes, Barnard Castle, Darlington, Stockton, West Hartlepool.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 2/-, and 2d. for every additional word. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable & Co. to ILIFFE & SONS Ltd., and crossed Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.4), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box ooo, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. ooo, c/o "Motor Cycle," 20, Tudor Street, E.C.4. *Replies to Box Number advertisements containing remittances should be sent by registered post, but in all such cases it is advisable to make use of the Deposit System.*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, ½ %. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

It is perhaps a little wearying to be continually urged to order your new machine, but it really is essential that you do not delay a day longer than is neceesary if you desire early delivery.

It is abundantly evident that there will be a great shortage of new motor cycles next spring and summer, and the limited supplies expected are rapidly being booked up.

We shall be pleased to send you catalogues of any of the following machines for which we have contracted, and if your order is placed with us it will be executed in strict rotation.

IMPORTANT NOTICE

CHANGE OF ADDRESS

WILL ALL CUSTOMERS KINDLY NOTE

that on and after **DECEMBER 20th, 1919**, this business will be transferred to entirely new Offices, Warehouses and Works, and the address will then be:

A. H. HUNT,
H.A.H. WORKS
TUNSTALL ROAD.
CROYDON, ENG.

Telephones: CROYDON 2225 & 2226.
Telegrams: "KEYAGE" CROYDON

ALL COMMUNICATIONS after December 20th should be sent to the new address

ALL GOODS should be carefully addressed as above, and consigned to
East Croydon Main Station

THE NEW PREMISES are 7 minutes' walk from East Croydon Main Station (L.B. & S.C. Railway and S.E. & C. Railway) which is 20 MINUTES FROM LONDON BRIDGE.

THE REMOVAL has been rendered necessary owing to the enormously increasing demand for H.A.H. Accessories and Specialities, and, in view of this, New Premises and Works have been specially built in order to

INCREASE PRODUCTION

and give all customers

FULL SATISFACTION by EARLY DELIVERIES.

Harley-Davidson.

WAUCHOPE'S, 9, Shoe Lane, London; Harley-Davidson 8h.p. 1916 combination; £155. [4965

KEMP'S Garage, Louth, Lincs, commence delivery of 1920 Harley-Davidsons this month. Book now. [X0417

HARLEY-DAVIDSON New 1920 Model F. solo in stock; list price.—Edwards, 7, Exhibiton Rd., South Kensington. [4824

1919 7-9h.p. Harley-Davidson Standard Model, just delivered; £154, first cheque secures.—F.E.W., 55, High St., Oxford. [X9550

BROOK Bros., Burnham-on-Sea, are now booking orders for early Harley-Davidson delivery in 1920. Write for particulars. [4565

HARLEY, 1916, beautiful combination; fetch £150 in the season, now £125.—51, Maplethorpe Rd., Thornton Heath, S.E. [5050

7-9h.p. Harley-Davidson, 1915, electric model, and 2-seater sidecar; reasonable offer accepted.—15, Weymouth Mews, Portland Place, London, W. [4597

1915 Harley-Davidson 7-9h.p. Combination, speedometer, lamps, 2 new tyres, little used 2 years, good condition; £105, offers.—80, Kingshill, Swindon. [4894

HARLEY-DAVIDSON, late 1918, Swan sidecar, polished aluminium disc wheels, lamps, Klaxon, fine turnout; £175.—H. D., 45, Venner Rd., Sydenham. [5169

LEICESTER Motor Cyclists are invited to examine the latest 1920 Harley-Davidson motor cycles now being shown at the Colmore Depot, 62, High St., Leicester. [3893

LIVERPOOL Motor Cyclists are invited to examine the latest 1920 Harley-Davidson motor cycles now being shown at the Colmore Depot, 24, Paradise St. Liverpool. [3894

1915 Harley Combination, been stored 3 years, recently overhauled and enamelled olive brown by the Harley people; £110.—W. Stobo, Maesydre Rd., Wrexham. [4790

BIRMINGHAM Motor Cyclists are invited to examine the latest 1920 Harley-Davidson motor cycles now being shown at the Colmore Depot, 31, Colmore Row, Birmingham. [3895

MANCHESTER Motor Cyclists are invited to examine the latest 1920 Harley-Davidson motor cycles now being shown at the Colmore Depot, 200, Deansgate, Manchester. [3896

1919 Harley-Davidson 7-9h.p. Combination, luxurious sidecar, electric lighting, hood, wind screen, speedometer, disc wheels; £215; appointment.—H., 142, King Henry's Rd., Hampstead. [4735

BROOK Bros., Burnham-on-Sea, are sole agents for the new Harley-Davidson models, and specialise in service to the owner; book your order now for early delivery. Write for our new catalogue. [0051

HARLEY-DAVIDSON 1915 Twin, and sidecar, hood, screen, special luggage carrier, all accessories, grand mechanical condition, fast and powerful; any trial invited; £130.—Debenham, Richmond, Yorks. [5238

HARLEY-DAVIDSON Khaki Combination, mag. model, electric lights, bulbous back sidecar, hood and screen, fully equipped, best cambination on the road; 175 gns.—Smith's, 10-16 Haverstock Hill, opposite Chalk Farm Tube Station. [0091

1917 (late) 7-9h.p. Harley-Davidson Combination, electric model, new tyres and tubes just fitted, Tan-Sad and fittings, screen, everything in really nice order, and is property of private owner giving up; bargain at £150.—Apply, Top Flat Door, 13, Mayow Rd., Forest Hill, S.E.23. [4704

HARLEY-DAVIDSON Combination, late 1916, Swan sidecar, with luggage grid, stand, apron, and Klaxon, lamps, pillion, mudshield, spares, just thoroughly overhauled, replated, enamelled, perfect condition, ridden carefully and infrequently; £135.—Robinson, 39, Catherine St., Salisbury. [5140

1916 Harley-Davidson, magneto model, with special coachbuilt sidecar, hood and screen, 3 electric lamps, tyres as new, enamel and plating unscratched, guaranteed in good condition throughout; this machine has been kept up regardless of cost; photo willingly; price £130, or very near offer.—2, Meyrick St., Pembroke Dock. [4270

BOOT REPAIRING.

"Elite Rivetless Soles."

Soles STUCK ON — NO TOOLS REQUIRED.

These Soles are specially prepared with an adhesive surface and fixed with Elite Sol-fix Solution. WE GUARANTEE THEM TO HOLD AS FIRM AS RIVETS OR SEWING. The process of fixing is exactly the same as that of repairing a punctured Motor or Motor Cycle tube. One of the many great advantages of our process is that no damage whatever is done to the Boots or Shoes which, when fitted with our Soles become ABSOLUTELY WATER-PROOF. Full instructions given with each pair of Soles.

PLAIN SOLES — PRICES:

Gents': Size.	Per pair.	Ladies': Size.	Per pair.
10-11	2/9	6-7	2/-
8-9	2/9	4-5	2/-
6-7	2/6		

Boys' and Youths': Size.	Per pair.	Size.	Per pair.
4-5	2/3	1-13	2/-
2-3	2/-	11-12	1/9

Sole Pieces, Adjustable.

Size 7 for 8 Boots	2/3
„ 6 „ 7 „	2/-
„ 5 „ 6 „	2/-
„ 4 „ 5 „	1/9
„ 3 „ 4 „	1/6

Sol-fix Solution:

In Tins 8d., 1/3, 2/6, and 4/6. An 8d. tin is sufficient for 2 pairs of soles. Solution Brush, 4d.

Please remit 6d. to cover cost of postage. Any excess will be refunded.

ELITE RUBBER Co.

Ltd. (Dept. A),

264-266, Vauxhall Bridge Road, VICTORIA, S.W.1.

MOTOR CYCLES FOR SALE.

Harley-Davidson.

HARLEY 1919 Electric Model, smartest outfit on the road (absolutely), mileage 2,200, guarantee with special built sidecar with detachable child's seat hood, wind screen, and footrest (cost 50 gns.), pillion seat, speedometer, separate accumulator for sidecar, spare chains and inner tube, a most gorgeous turnout bought car; £200, no offers considered.—Jones Bros. Dairy, Santley St., Brixton, S.W. [481

Hazlewood.

HAZLEWOOD, 2¾h.p., 3-speed solo, J.A.P. engine guaranteed mechanical condition, speedometer reasonable price.—Winchester, 35, Clarendon Rd., Hove [467

5-6h.p. Twin Hazlewood-Jap Combination, coach, 3 speed countershaft, kick start clutch, chain-cum belt drive, very powerful, guarantee and trial given lamps, etc.; £80.—97, Mount Grove Rd., Highbury, N [X008

Henderson.

4-CYL. Henderson Combination, in first-class order speedometer, horn, and lamps; £85.—Grimes, 11 Bruton Place, Bond St., W. [484

1920 4-cyl. Henderson Combination, mileage under 200; £195; seen at Marston's, 31, Bridge St. Chester.—Graham, Spring Rd., Wrexham. [478

LANCASHIRE, Cheshire, North Wales, and Isle of Man.—Enquiries for Henderson 4-cyl. invited.—J. Blake and Co., Official Dealers, Liverpool-Manchester. [703

H.B.

H.B., 1920, 2¾h.p. Blackburne engine, 2-speed, kick starter; 85 gns.—Early delivery from sole district agents, Joseph Devey and Co., 50, Darlington St. Wolverhampton. Tel.: 606. [X035

Hobart.

HOBART 4¼h.p., good running order, tyres sound £15.—Ruddock, 3, Forest Lane, E.15. [485

1919 Hobart, 2½h.p. 2-stroke Villiers engine, as new, accessories; £59/10.—Hayllar, Newport Pagnell. [462

SEVERAL Hobart Machines of our first batch still unallotted. Early delivery assured. Send stamp for descriptive leaflet from sole agents for Brighton and Hove, The Goldstone Motor Cycle Depot, 32, Goldstone Villas, Hove. [X996

Humber.

HUMBER 6h.p. Water-cooled 3-speed Twin, Combination; £93.—Halifax Motor Exchange, Union St. South, Halifax. [483

3½h.p. Humber, 2-speeds, with Canoelet sidecar, good running order; £60, or near offer.—Apply, 4, Mary Abbotts Place, Kensington. [5202

HUMBER Lightweight, just overhauled, Bosch, B. and B., Lucas lamps, new cover and tube, spares; ride away; £35.—15, Angel Lane, Hayes End, Middlesex. [4732

1919 Humber, twin horizontal engine, fitted with Canoelet sidecar, P. and H. lamps and horn; £145.—King and Harper, 6 and 7, Bridge St., Cambridge. [4692

1914 Humber, 3½h.p., engine No. E4657, good running order, Sturmey-Archer 3-speed hub, P. and H. lamps, horn, coachbuilt sidecar; £68; London, N.—See Kwiksale advertisement, Miscellaneous Sale column. [4874

HUMBER 1915 4h.p. and Coachbuilt Sidecar, recently thoroughly overhauled, 3-speed hub gear, kick start, complete with lamps, horn, etc., perfectly reliable outfit; £70.—Apply, Gas Distribution, Ltd., Nuneaton. [X0400

HUMBER 6h.p. Water-cooled Horizontal Twin, Lucas dynamo lighting set with car lamps, specially coachbuilt sidecar, aluminium panelled, with hood, screen, side curtains, etc., upholstery leather, speedometer, and horn, full set tools and spares, photo, any trial.—Apply, Box L6,034, c/o *The Motor Cycle*. [5266

1919 (June) Humber Twin and Montgomery Sidecar, apron, mat, horn, 3 unused Lucas acetylene lamps, tools, spare links and plugs, 2 pairs goggles, used 4 months only, just overhauled, looks splendid and mechanically perfect; seen Coventry; first offer £130 secures.— Apply, Box 903, c/o *The Motor Cycle*. [X0399

Indian.

EGERTONS, Northgate Street, Ipswich, can give early delivery of Indian ordered now. [4634

INDIAN 1914 7-9h.p. Combination, in good order; £87.—Longney, Bailey St., Oswestry. 'Phone: 128. [X9726

INDIAN.—For earliest deliveries, get in touch with the Indian agents, Newport Motor Co., Ltd., Newport, Mon. [0041

1920 Indians; prompt deliveries.—E. Brown, Indian Specialist, 3 and 7a, Parker Lane, Burnley. Tel.: 194. [X0334

WAUCHOPE'S; Indian 7-9h.p., 1914, 2-speed spring frame and sidecar, £87/10; also another, also 1914, £85. [4966

1915 Indian, 7-9h.p., 3-speeds, clutch, spring frame, all accessories; best offer over £65.—8, Station Parade, Balham, S.W. [5047

Sidecars for Trade Purposes.

FOR many years the motor cycle movement in France was apparently moribund, and, in appreciation of the commercial value of the sidecar outfit as a means of transportation, England and America undoubtedly took the lead. During the war, however, the practical worth of the sidecar was demonstrated to our French neighbours in no uncertain manner, and we now find that they are in a fair way to commence the teaching of their masters.

Almost the first news item concerning civilian motor cycling which we received after the Armistice was that, in order to relieve the taxi-cab shortage, motor cycles with comfortable sidecars attached would ply for hire on the streets of Paris. That this venture failed (although in no way was it due to the motor cycle not performing its duties efficiently) is rather outside the sphere of these remarks: the essential point being that in our own country similar efforts were frustrated in their conception by the refusal of the authorities approached to grant hackney carriage licences to motor cycle outfits, the reason being shrouded in obscurity.

While the small private trader has for some time demonstrated his faith in the sidecar as a light delivery vehicle, surprisingly few large bodies or firms have seriously considered this handy form of transport.

In France, however, a move in the right direction has again been made by a company which proposes to use at first a number of British machines, and later will adapt a French product, which may be counted amongst the latest and most advanced types of motor cycle. This firm has equipped a fleet of large sidecar delivery vans, and purposes to hire them out by the day at a fixed fee, based on a certain maximum mileage, the charge covering the services of an expert and trustworthy driver.

Besides performing a useful public service, no finer propaganda scheme for the general benefit of the movement could have been evolved. Those who have been attracted by the obvious merits of the sidecar for the rapid transport of miscellaneous goods will be enabled to test its capabilities without the expenditure of capital in the purchase of an outfit. Furthermore, it is almost certain that those who at first avail themselves of this service, even without any serious thought of themselves owning machines, will turn their ideas in that direction after having its efficacy demonstrated to them in the ordinary course of the work performed.

Aero Engine Practice.

LIGHT weight and a wide weight-power ratio are absolute essentials in the designs of two types of machines, *i.e.*, the motor cycle and the aeroplane. Therefore, aero engine design is likely to have great effect upon the future motor cycle engine.

No doubt much was learned during the war which will be of inestimable value to motor cycle engine designers and all who are connected with the production of such engines.

Probably the three greatest points where aero engine practice will influence the motor cycle are: (1) The reduction of weight, (2) the use of aluminium cylinders, and (3) overhead valves. Regarding the last-mentioned, there appears some doubt in the minds of many that considerable risks attend the adoption of overhead valves, and that there appears to be a tendency for makers to "leave well alone." Leaving well alone is synonymous with stagnation. The recent successful flight from England to Australia has demonstrated the reliability of overhead valves, for the two twelve-cylinder Rolls-Royce Eagle engines, with which the flight was accomplished, were fitted with such valves, and the fact that forty-eight overhead valves continued to function for a flight of eleven thousand miles should be sufficient proof that, properly designed, the overhead valve is as reliable as the side-by-side type.

An index to the advertisements in this issue will be found on the page facing the back cover.

Automatic Carburetters.

THE vogue of the automatic carburetter is increasing by leaps and bounds. Every carburetter maker has one on offer, and many motor cycle makers now give us the option. We are still waiting for the one-lever device which will give us the efficiency of the two-lever with no sacrifice of economy. The trouble, of course, is that if an automatic affords an easy start from cold and will take the road without a lot of warming up, it is usually extravagant in fuel. But designers are optimistic, even about this. I should not be surprised if we find standard 500 c.c. engines doing their 100 m.p.g. on one-lever carburetters before long.

Flowmetered Jets.

IN the old days we all placed a childish trust in the numbered jets which we bought to experiment with on our carburetters. A "32" jet, we fancied, was the dead spit of every other "32" jet, so long as we did not gouge it out with a knitting needle. Then the war came along, and science was enlisted to help the Government in trying to get good results quickly from its millions of carburetters; and science found that, out of a dozen jets stamped with the same figure, no two gave the same fuel delivery. Finally, the flowmeter solved the problem, and jets became genuinely interchangeable, so that differences in individual engines remained as the chief variant in providing good carburation for a big batch of engines. I was under the impression that all motor cycle jets were now flowmetered. It is not so. In many instances the jet size numbers are still only a vague and approximate indication of the fuel which a jet will deliver. By the next Show, most jets will be accurately flowmetered: but for the present testers, whether professional or amateur, must continue to take jet sizes with the usual pinch of salt in the absence of definite information to the contrary.

Four-wheeled Competition with Sidecars.

A GENERAL rise in prices at or before the car Olympia has distinctly weakened the threatened competition between sidecars and four-wheelers, for the prices of the latter are now well above current sidecar figures. Thus, the A.B.C. sports car is now listed at £295. The Rover stands at £230, the Palladium two-seater at 275 gns., and the Cosmos at £210 (the latter will not be available for nine months or so). The redesigned G.W.K. is now catalogued at £275, and the Grahame-White Buckboard at 95 gns.; since the latter only boasts 3 h.p. and two speeds, it cannot compete with a high-powered combination. Of course, we do not know that the bigger sidecar outfits will keep below the Cosmos and Rover price levels; but it is doubtfu whether cycle cars will have any serious effect on th sidecar market for some time to come. Our ol friends, the G.N., L.M., and Carden are still th sole high-performance four-wheelers at a motor cycl price, unless one or two newcomers should prove t be livelier than their specification suggests. On th other hand, there are at least half a dozen differen makes of three-wheeled runabouts on offer.

Watching the Wheels Go Round.

YOU cannot identify the best exhibits at Olympi by spotting the points at which the crowd i thickest. Novelty usually draws a crush, bu a sound technical novelty does not necessarily attrac unless it has great publicity or extreme cheapness a an extra draw. But when all is said and done, th best possible draw is to set some bit of mechanism in motion with the aid of an electrical motor—rathe noisily, for preference. I thermometered the en thusiasm at Olympia on several occasions, and th result was always as follows, the crush being tabulate in order of thickness:

(1.) Rudge stand (multi gear in motion).
(2.) A.B.C. machines (novelty, plus publicity).
(3.) Sundry scooters (novelty, plus cheapness).

By comparison, some of our staunch old roadster or such unboomed but excellent novelties as th Beardmore-Precision did not magnetise the crowd: but they got the business all the same. When I stag a motor cycle of my own invention, I shall saw fou complete machines in half from end to end and ru them off the electrical main from 10 a.m. to 10 p.m daily. It will cost a lot in current, but my stand wil be simply impassable.

All Belt.

I SEE an Overseas correspondent is still hankering after belt drive. No man could have been more conservative in that respect than I was, and I am still distinctly fussy when I select a chain drive: there are several patterns on the market which I will not touch with a bargepole. Nevertheless, I proclaim my general conversion. If most of my riding were done in ordinary British undulating country, I should still be faithful to the belt for solo work: under such conditions, I know nothing to equal a Rudge or Zenith. I have recanted simply and solely as the result of freak hills. Annually, or twice a year since 1910 or thereabouts, it was my fate to tackle a Six Days in the assorted weather which usually accompanies those jaunts. The combination of a fierce hill, a small pulley, and pouring rain, occasioned me worlds of trouble. I switched over to the chain-cum-belt, and was perfectly satisfied with it. I should still use it if

Occasional Comments.—

the sidecars had not driven the trade off it to a very large degree; and, as a solo man, I ask for nothing better. I now use a lot of all-chain drives because they figure on machines which are otherwise desirable, and because they have lost their old harshness, whilst constructional details, though seldom perfect, are at least free from the old crudities. It must be admitted that the proper sphere of the all-belt drive is now identified in the solo 'bus, and by emphasis in the solo 'bus designed for fast work in easy districts. The chain, with such faults as it retains, is unquestionably the best drive for exacting duties with a sidecar.

Air-cooling at the Car Show.

THE many motor cyclists who visited the Car Show at Olympia naturally made tracks for the stands on which air-cooled cars were exhibited. Those of us who still dare to yearn for hoseable machines were specially interested in the cowled engines. It was obvious that the designers of air-cooled engines for cars fall into clearly defined schools. On the one hand, there are audacious people who drill countless holes in the front of the bonnet, and leave the engine as a whole to cool in the vague draught which filters through these orifices. On the other hand, a rival school boxes the engine in with metal plates till it looks as if it were water-jacketed, cut a single air intake in the box over the cylinder head, mount an air scoop handily in the side of the bonnet, and employ an enormous fan to suck air through the cowling. If we take both schools at their own valuation, the deductions—so far as cars are concerned—are that a naked engine will keep decently cool in an aimless kind of draught, which slops itself at random over the whole exterior of the engine; but that even better cooling is obtained by boxing the engine in and using forced draught over the hotter parts of the cylinder. (One suspects *en passant* that a perfectly designed engine requires no cowling.) Applying these presumptions to motor cycles, one draws the moral that our engines require no cowling or fans, but that if anybody should take it into his head to design a smooth-sided motor cycle, encased in aluminium covers, capable of being cleaned in five minutes with a hose and sponge or a wet cloth, the job would be quite simple, and the cooling would be—if anything—better with the covers on than with the covers off. It follows, incidentally, as the Car Show proved, that accessibility would be slightly impaired, and that manufacturing cost would be fractionally increased. But if any revolutionary produces a motor cycle which conveys no suggestion of a porcupine, and has no objection to a hot bath, he will find customers galore.

THE GREAT NIGHT RIDE.

Already the problems of lighting are being faced by entrants in the M.C.C. London-Exeter trial, the start of which takes place on Boxing night from Staines. The photograph depicts a scene at the start of the last trial held in 1913

Shocks in Gear Changing.

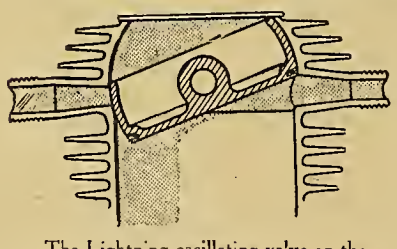
SOME of our correspondents have not fully grasped one of the points which I desired to emphasise anent gear changing. With many machines a gear change entails a physical shock reminiscent of stubbing one's toe against an unseen doorstep. The gear goes in with certainty, there is no mechanical noise, but the machine pauses, shakes itself, and goes on again. Such an experience is not unknown on a bad car handled by a clumsy driver, but on most cars the gear change is sufficiently simple to be mastered by the average driver. On bicycles it is not. An expert can effect a shockless change with almost any bicycle, but some of the best bicycles baffle a rider of ordinary skill. The problem is, of course, much thornier than that which a car presents. The steering and the clutch account for the contrast. One hand at least, and very possibly both, are really absorbed in steering, and a lightning removal of one hand from the bar is all that can be spared at speed or on rough going. Secondly, the clutch is usually very small, and neither the foot nor the hand is sufficiently composed to operate controls delicately, unless the frame is sprung; with a spring frame, gear changing becomes similar to car driving, but not when a rigid frame subjects wrist and ankle to jerks and jolts and vibrations. For all these reasons changing on the valve lifter is approved by many designers, and such a change usually necessitates a shock; the shock in turn normally promotes a momentary wobble. Perhaps the chief exceptions to these common faults are the infinitely variable gears, *e.g.*, the Rudge and Zenith. With such designs there is no break in the drive during gear changing, and it follows that there is no shock. There may still be a wobble, but if so it is exclusively due to loose steering while one hand visits the gear lever: and such a wobble will be less pronounced than a shock-wobble, and can only occur at very high speeds or on very rough roads.

This matter is admittedly not of prime importance, but our trade should note that it forms part of the modern idea of comfort, and the Americans are taking it into account.

NEW IDEAS IN 1920 MODEL ENGINES.

By CAPT. W. GORDON ASTON, A.F.Ae.S., A.M.I.A.E.

TO the speculative technical mind, and in regard to new features of engine construction especially, the Motor Cycle Show is habitually more interesting than the Motor Car Show which precedes it. The reason is not at all far to seek. Designers of motor cars are on the average considerably more progressive, and yet at the same time more "much-of-a-muchness," than those who scheme out new motor cycles. Also, it may as well be frankly admitted, they are decidedly better engineers. Thus between the worst car and the best there may be no very wide gap, whereas between the best and worst motor cycles there is a great gulf fixed. This is because the majority of motor cycle manufacturers are highly conservative: they have found themselves in grooves which are safe and profitable, and they show no inclination to leave them (and with things as they are, why should they?); whilst others, full of enterprise—and in some cases more full of enterprise than sound engineering knowledge—are positively venturesome. I am not for the moment referring to the accepted and established maker for whom progress has got into a regular sort of swing, but to the numerous newcomers who, here and there, make an Olympian *début* before the critical public. Instructed to dig out any new ideas in engine design which caught my eye, I found that most of them bore unfamiliar names. It is as though the motor cycle movement were being gingered up from the outside because its internal springs of energy had shown signs of drying up. This I take to be a good augury for the future; it is, at all events, some warranty against possible stagnation, which, in the motor cycle industry, the same as in any other, is invariably the by-product of progress. In present circumstances, it is more than any established maker can do to keep pace with the insistent demand, and, therefore, for him to have left the sound path for the experimental track would have been utterly foolish. For my own part, I think, however, he might, as a type, have shown a little more enterprise and a little less conservatism. Probably, however, he has plenty of plans for the future, although he would appear to be keeping them under his hat. If the figures as to output, commonly given in response to enquiry by the various makers, are to be trusted, these new ideas will be called for in a year or two's time for certain, for by that time, with supply catching up demand, hand-over-fist competition will have put a premium upon progress, and that which is merely conventional, and materialises the "playing-for-safety" policy, may have to take a back seat.



The Lightning oscillating valve on the Coulson B.

In dealing with such a subject as new features in engine design, it is very difficult to treat the matter on a logical basis and endeavour to bring novelty into definite relation with standard practice. I believe, however, that motor cyclists are, as a rule, extraordinarily well informed as to what is going forward in technical directions, and I shall, therefore, make no excuse for striking out on a purely haphazard course—much as one does at Olympia, however logically and systematically one may have planned the circuit.

A Rocking Valve.

A curious type of valve was to be seen, on the Coulson B stand, adapted to a single-cylinder engine. I understand that the name of it is the Lightning. In view of its curvilinear character, this name may possibly be a side reference to Mr. Einstein. The character of the valve is made clear in the sketch. It consists practically of a rocking cylinder head working within a spherical sided chamber, and oscillating so as to open and close the exhaust and inlet ports, which are at opposite ends of a diameter. The valve, which is neatly placed in position through a vertical slot in its housing, is furnished with a couple of rings at its base, which share a common groove. It is worked through a crank from a "tramway" cut in the face of the flywheel, in the manner of the old Motosacoche, or by any other convenient reduction gear. Since it has varying intervals of rest and motion, it is worked in a series of jerks. This appears to be its worst feature, as the inertia of the valve is considerable, although this, I was informed, has been reduced to the minimum by making it of an alloy of steel and aluminium, the composition of which I am ignorant. The other objection is bad cooling, owing to the dishing of the head and the impossibility of maintaining molecular contact between the valve and its casing through the necessary film of lubrication. Undoubtedly, however, the Lightning valve gives a quick cut-off and a big port, and I am not surprised to be told that on the test bench it has led to some very high revolutions being obtained.

The piston used in the 5 h.p. two-stroke Stanger.

A V Twin Two-stroke.

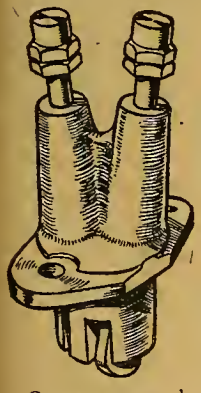
The Stanger 5 h.p. twin two-stroke is an interesting and well-made engine, and of a type that appears to have a considerable

New Ideas in 1920 Model Engines.—

future, although, in a sense, its design is subservient to the requirements of the ordinary type of motor cycle frame. It is, in fact, intended to supplant the ordinary V twin four-stroke. It has double the torque of the latter, but the firing intervals are not regular, as each interval is alternately 180° plus or minus the angle between the cylinders. In this regard, the Stanger engine is not so good as the Scott type. The crank chamber is divided by a wall, and split horizontally. The centre bearing is provided with gas-tight washers, and is lubricated independently of the rest of the engine by a grease cup underneath the crank chamber. The big ends are fitted with roller bearings, the rollers being chamfered at each side, and thus allowing a distinct radius to be retained on the crank pin. The engine is of the three-port type, the inlets being arranged on the thrust side of the pistons, and the transfer ports and exhaust ports are on the non-thrust side. This is certainly bold practice, as it is directly opposed to accepted two-stroke principles. But I understand that the motor has given good results. I give a sketch of the piston, which illustrates the peculiar arrangement of the deflector, the gudgeon pin (partially withdrawn), and the bottom ring with its locating peg.

Designed for Ease of Production.

Several instances of originality are to be found in the single-cylinder Corona engine, which is principally notable for having its cylinder and crank chamber in one piece, on top of which was placed a detachable aluminium cylinder head. The crank chamber is open-ended after the fashion of the old Clement-Garrard. This is a form of construction that has many advantages, and ought especially to be economical. The whole design of this unit is directed towards simplification and low production cost, and the solution of the various problems appears to be very practical. In order to use a single cam, or, rather, two cams on one body, the valves are arranged at an angle to one another, the disposition of the tappets being as shown in the sketch. These tappets have flat shoes which bear directly on the cams. This is more or less common motor cycle practice, but it is difficult to understand why rollers should not be more frequently adopted. Another interesting feature of the Corona engine is that the lubricating oil pump is driven by the magneto chain which rides over its sprocket.

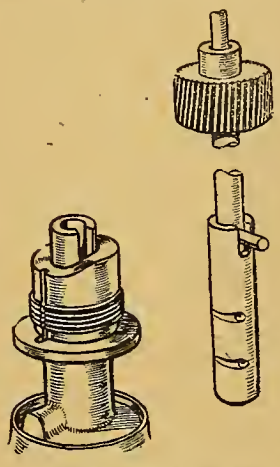


Corona tappets and valve guide.

The Dunelt 500 c.c. two-stroke is a formidable single-cylinder motor, which, however, is of pleasing appearance, and has many commendable points. In this engine the exhaust port is dead in front of the cylinder, whilst the inlet and transfer ports are each threequarter rear, so that they are at least partially under the thrust of the piston. This last has two diameters, the lower having the effect of promoting the crank case compression. On its down stroke it draws in a charge round the small diameter of the piston, so cooling it, and the up stroke passes this charge through a subsidiary transfer port back into the crank chamber. Double-diameter two-stroke cylinders have often been proposed, but this seems to be about the best materialisation of the idea that one has seen.

Reducing Crank Case Space.

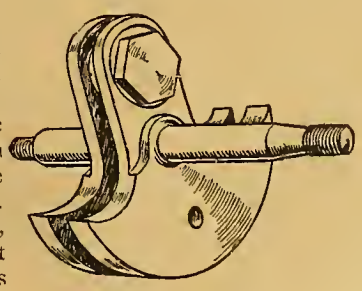
I am greatly impressed with the neatness and generally admirable design of the Velocette, which I think calls for the highest praise. As far as the main layout of the engine is concerned, conventional lines are followed as to the motion and the arrangement of ports, etc. The open-ended crank chamber is furnished with a screwed aluminium end plate, which holds in position a solid aluminium block that serves to reduce the gas content of the crank chamber to a minimum. The plate gives a desirably smooth external finish, and is easily removed for the purpose of giving access to the connecting rod and big end, etc. It also makes for great simplicity in machining. The Velocette engine is particularly distinguished by its mechanical lubricating system—decidedly unusual in so modest a unit—for which purpose the oil is carried in a sump in the base chamber, filled through a hinged aluminium lid just beside the cylinder foot. The oil pump is of the plunger variety, and its principal details are shown in the sketch. A vertical rod is rotated by a low gear worm on the magneto drive. As well as rotating, the rod, which is in fact the plunger, is reciprocated up and down by a face cam against which a right-angle pin upon it is held by an adjustable spring. By means of the latter, the feed of oil can be regulated through a graduated thumb nut. Outside the plunger is a sleeve which fits inside the cylinder, which last is bolted and flanged to the crank chamber bottom. The sleeve is provided with ports which, in accordance with the movements of the plunger, provide an inlet and outlet for the oil.



Components of the Velocette oil pump.

A Novel Exhaust Pipe.

Another two-stroke of remarkable interest is the Cedos, which is full of good points and redolent of experienced cleverness. The piston, for instance, complete with its deflector, is so designed as to be easily machined all over, the radii being struck so that, where a face plate cannot be employed, a form miller can be brought into action. The exhaust port, which is on the front of the cylinder, is very wide and is in



The Cedos crankshaft

New Ideas in 1920 Model Engines.—

duplicate, both opening into a bulb-shaped arrangement on the exhaust pipe. This is shown in the sketch. It might be suggested that this formation is not productive of the best streamline shape, but, as the exhaust flow is irregular, it is more than probable that any disadvantage in this direction is more than outweighed by the free and immediate expansion which the bulb allows.

Exhaust box and silencer of the Cedos lightweight.

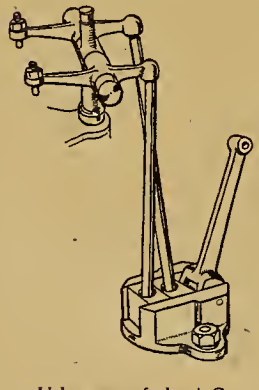
Great care has been taken in this engine to keep the crank chamber as small as possible. It is, in fact, only 1¼in. wide. The crankshaft, of the shape shown in the illustration, is built up. The narrow crank pin fitted with roller bearings for the big end, is tubular, and is integral with the main crank cheek. One noticed on the Cedos engine that the top radiating fin was a disc of copper held in position by the compression release valve. This is an eminently sensible idea, as it is always the top fin which gets most easily damaged.

With a view to enhancing cooling effect, many engines, including Douglas, J.A.P., and Blackburne, are furnished with finned exhaust valve caps. Such unanimity of opinion points to this notion being thoroughly practical and of unquestioned advantage.

Valves.

One is glad to see that more makers have adopted detachable cylinder heads, as, for instance, Raleigh, Clyno, and Precision. The two-stroke of the last make is an exceptionally interesting design, with its chain-elevator lubricating system, but need not be described here as it has already been fully dealt with.

Amongst new valve ideas one noticed the telescopic spring covers of the Indian, the exhaust placed over the inlet on the Martinsyde (this is in accordance with the pre-war A.B.C. and aircraft engine practice, but the direct opposite of the Rudge-Whitworth system), and the arrangement of the flat twin Humber engine, in which the valves are in seats which are separate and clamped down on to the L cylinder head. This last system is not found on any other engine, and is a modern and apparently excellent adaptation of an old principle.



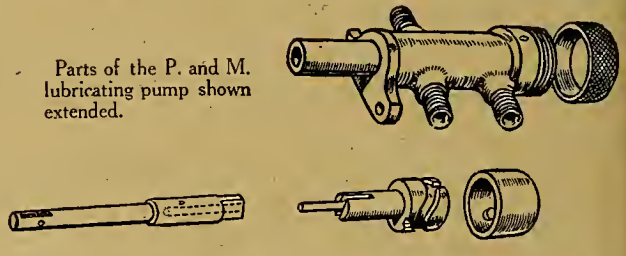
Valve gear of the A.C. Junior.

The A.C. Junior is a peculiar machine, into the pros and cons of which I do not propose to enter. The valve design is, however, strikingly novel. Both valves are overhead, and are worked by rods and rockers. As in the case of the Corona, simplification is sought by using a single cam body and inclining the tappet rods, as shown in the sketch. This occasions a slight side thrust on the rockers, but this is probably of very small consequence. The exhaust valve lifter is, as will be seen, very neatly devised.

Several notable points are to be found on the new Brough, in which, first of all, we remarked that, although the cylinders are horizontally opposed, the fins are at right angles to the cylinder axis. It is hard to see why this should have been done, but no doubt it works all right. The disposition of the motor in the frame is unusual, the crank chamber being made to act as a frame component. The front down-tube is taken to the timing case so as to leave the front cylinder overhanging and entirely unobstructed. The foot-rest bar, which is carried by an aluminium bracket in the crank chamber, struck me as being a somewhat dangerous piece of design. I should have thought that so vulnerable a part had better be attached to the frame rather than to an aluminium casting. On this engine the valve springs were let deeply into the valve chests.

Mechanical Lubrication.

In regard to cooling, the horizontal fins on the sloping P. and M. cylinder are notable, and will undoubtedly lead to higher efficiency. This engine is now fitted with a mechanical oiling system of a very complete character. The various parts of the pump



Parts of the P. and M. lubricating pump shown extended.

are illustrated in the accompanying sketch. One of the valve cams carries a worm gear which rotates a rod with a flattened lower end. This rod is drilled to form a very small cylinder, into which fits a plunger carried in an extension of the rod, which also has a groove fitting the flattened tongue already mentioned. This enables the two parts of the rod to revolve as one piece, but to move axially relatively to each other. Reciprocation of the plunger is effected by a "wobbly" cam engaging with a peg on the inner wall of a collar. The whole fits inside a small barrel casting attached to the crank chamber. In its rotation the rod uncovers inlet and outlet valves, and, drawing oil from the tank, discharges it through two pipes to the cylinder and to the big end respectively. In the latter case the feed is to an undercut annulus in the flywheel, whence centrifugal force drives the oil to the crank pin. Needless to say the workmanship on the P. and M. oil pump was of the very finest.

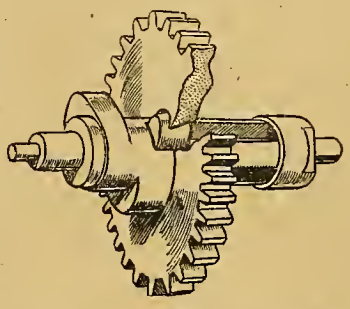
An Unusual Combustion Chamber.

One of the most unusual engines in the Show was the Black Prince horizontally-opposed two-stroke. This is of 480 c.c., with a bore of 73 mm. and a stroke of 60 mm. In this, contrary to usual practice, the pistons have flat heads. A single inlet port admits gas to the common crank chamber through a ring of holes, whilst each cylinder has its separate exhaust at the bottom of the stroke. The two cylinder heads

New Ideas in 1920 Model Engines.—

are united by a finned cast iron pipe containing the single sparking plug and a decompressor valve. The latter acts as a cut-off valve also, and I understand that it is intended that ultimately this valve shall be mechanically operated. On the out stroke the pistons induce gas from the carburetter, on the following in stroke they compress it in the crank chamber until the valve aforementioned opens and the charge is expelled to the cylinders, so accelerating the outlet of the exhaust. The single explosion applies to both pistons equally, and it remains to be seen whether the idea of igniting the gas in a long pipe instead of inflaming the cylinder-full is a good one. Off-hand one would think it was bad for several reasons, the principal being that the combustion chamber is very ill-shaped and not at all what the interests of efficiency would dictate. A common silencer for both cylinders is placed underneath the engine, and it is undeniable that the whole forms a neat unit.

The power plant of the Whippet scooter has many points of interest, with its aluminium piston, aluminium cylinder with steel liner pressed in position, and detachable cylinder head. It is, in fact, a very remarkable little miniature. I found that an unusual type of decompressor is fitted, the same being diagrammatically shown in the sketch. A single half-time wheel is integral with the inlet and exhaust cams. The latter is arranged so that a secondary and rudimentary cam can be slid into operation along the hollow spindle of the cam body, this small cam being normally held by a spring in a cavity in the exhaust cam. This device certainly has the merit of simplicity, and, so far as one could tell by turning the flywheel of the engine whilst actuating the decompressor, the secondary cam is easily brought into action.



Cam gear of the Whippet scooter.

A Diatribe on the Discomfort of Saddles.

The Opinion of a Motorist on Motor Cycle Seats.

ONCE upon a time my friend "Ixion" criticised a few cursory remarks of mine in *The Autocar* on the extraordinarily conservative use of the push-cycle saddle long after its original *raison dêtre* has departed. I forget all that I wrote about it—it would be a horrible thing to be able to remember all one's weekly outpourings: my brain would become absolutely clogged—but I am not convinced in the least by his argument that that eternal triangle is incapable of improvement. I *hate* a bicycle saddle. Very often my present one has hurt me very much indeed, although I must confess that, as a rule, this has been because I have omitted to remove my trouser-clips, which I keep, as a rule, stuck into the ventilating hole in its middle for convenience sake. Mine is a Brooks, and marked for a man of fourteen stone, so evidently I cannot better the best.

I have tried others. In 1896 I had a pneumatic one warranted to make cycling a pure joy. That burst one Sunday afternoon, and thenceforward I was resolved that there is nothing like leather. A friend of mine has a push-cycle made like an attenuated Forth Bridge, with a saddle resembling a string bag, but I know of no other variation. All cycle saddles are perforce the very last things in uncomfortableness, and I grieve for the future of motor cycling if its experts and inventors cannot find in all the resources of civilisation some form of seating accommodation other than a direct copy of the primitive kind, only constructed originally for a purpose entirely different from its present use.

How the Cycle Type Saddle Fails.

Go to, "Ixion." Your arguments remind me of the bear that lost its tail tobogganing, and went round to all his friends telling them that no tails were the only wear. Truly, just as there are more ways of killing a dog than by hanging him, there must be many more comfortable forms of seating accommodation for motor cyclists than perching on a narrow hard shiny leather strip, simply because it used to be the only way to reach both pedals in the days when one's feet were one's only horse-power.

Consider a cycle saddle. Just as the earliest motor cars were copies of ordinary horse vehicles, and as the earliest railway carriages were exact cribs of stage coaches, so the cycle saddle of to-day is nothing but a reduced type of horse saddle, even to the flaps. I almost wonder who was the bold reformer who did away with stirrups. Now that recognised flapper brackets have taken the place of pillions, I should have thought that someone would have had the courage to bring saddles up to date. But, no, they persist, just as do turned-back cuffs, the slits aft our evening dress, and the two lost little, lone little, buttons that live in sheer uselessness at the middle of our tail-coats, in the spot that is euphemistically called the small of our backs.

The Ultimate Test.

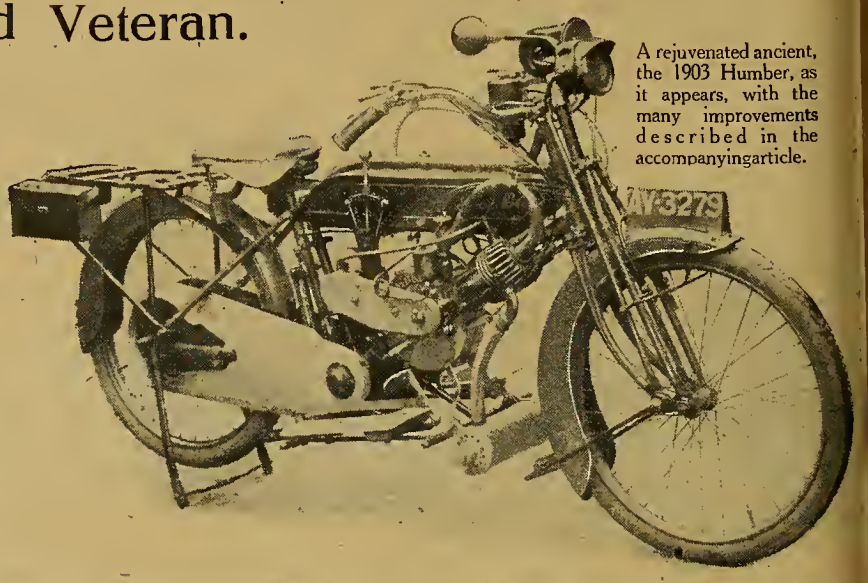
"Ixion" said my words betrayed me and showed that I was not a motor cyclist myself. I was, many years ago, but, not knowing how to stop my first mount, the owner would never let me try again. Then I married and, of course, I wanted a car; a "bicycle built for two" did not tempt me and, far less, her. Since which time a motor proper has furnished all I need to ask. But I must confess that—so fascinating must motor cycling be to make over a hundred thousand motor cyclists so interested in *The Motor Cycle*—I am to-day attracted by the notion, although I feel I am getting on towards the sere and yellow, as they say. Perhaps—who knows?

If I am wrong in my notions as to the effeteness of the modern motor cycle saddle, I want to feel I am wrong. If I am right—well, I do not want to feel it at all.

I trust I have made myself clear. OWEN JOHN.

A Modernised Veteran.

Some Up-to-date Features incorporated in a 1903 Humber, which Still Continues to Give Satisfaction.

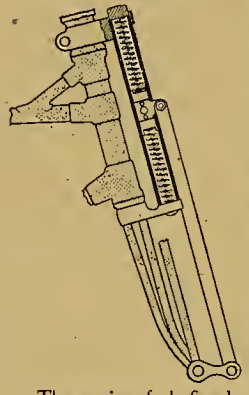


A rejuvenated ancient, the 1903 Humber, as it appears, with the many improvements described in the accompanyingarticle.

DESPITE the fact that it is one of the earliest machines made, the chain-driven Humber which forms the subject of this article is still giving great satisfaction, while thanks to the skill and ingenuity of its owner many up-to-date improvements have been made from time to time.

Mr. J. A. Mills, a motor engineer of Mansfield, who is responsible for these alterations, tells us that the parts still remaining of the original machine are the engine, the main blades of the front forks, the chain stays and bracket shell, and the hubs, which, with their cups and cones, are still in perfect condition.

The specification of the machine is now as follows: Spring forks, adjustable handle-bars, magneto ignition, large silencer, sprung saddle interconnected with aluminium footboards, clutch, and two-speed chain transmission, aluminium chain cases, internal expanding brake, and improved carrier.



The spring fork fitted by Mr. J. A. Mills to a 1903 Humber.

Engine fixing is arranged on the same lines as those made familiar by the P. and M., *i.e.*, long bolts pass through the crank case to the cylinder head. The engine, of course, is of the automatic inlet valve type, and it has been improved by the fitting of a B. and B. carburetter and a weatherproof magneto. A long head is incorporated in the frame, which is otherwise conventional in appearance.

A Spring Seat-pillar.

Suspension of the Brooks saddle is effected by a seat-pillar hinged on the frame and supported by a plunger working in a tube against the resistance of two compression springs. This tube is hinged near the bottom bracket, and midway down its length between the springs is a sliding block connected to an arm, which, in turn, carries the rear cross-bar of the footboards.

Front springing rather follows American practice and the device consists of short links pivoted at the ends of the rigid forks. These carry the hub spindle, and they are connected by a fork to a sliding block working in a large tube in front of the steering head. The movement of this block is controlled by coil springs, one above and one below, in the same way as the footboards are sprung.

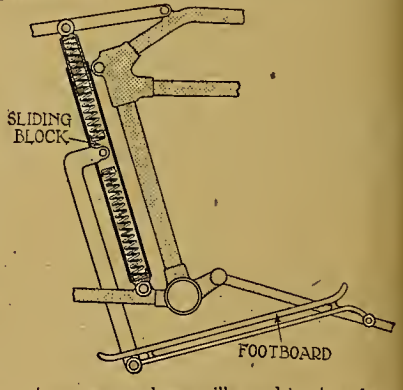
A large and sturdy carrier has been fitted, and this, together with the mudguard, can be swung out of the way on removing four bolts.

Two-speed Gear.

Transmission is by a chain to the countershaft, through a metal cone clutch on the engine-shaft. This clutch was turned out with the engine, and is still in perfect order, but a ball thrust has been added to take the pressure when disengaged. From the countershaft two chains convey the drive to the rear wheel, sprockets of different size being used on either side to secure the high and low ratios. The countershaft sprockets are engaged by a double sliding dog, operated from a neat control beside the tank.

It is interesting to note that the high gear Renold chain has been in use for the last eleven years—surely a record! An internal expanding brake is fitted in the right-hand rear sprocket.

Other features worthy of note are the quickly detachable aluminium chain cases and the reversible and adjustable handle-bars.



Interconnected seat-pillar and footboards, showing springing system.

Altogether the detail work, as can be seen in the photograph, is exceedingly well carried out, and it reflects great credit on the practical abilities of the owner.

LIGHTS ON VEHICLES.

WE give below the evidence to be submitted by the Auto Cycle Union to the Lights on Vehicles Committee appointed by the Ministry of Transport:

The Auto Cycle Union recommends that Part I. of the Lights (Vehicles Order) of December 16th, 1918, touching the carrying of rear red lights, be permanently adopted subject to slight amendment as to the position of the lamps as follows: Section (I.) (a) The lamps should be placed as near as reasonably practicable to the extreme off and near side of the vehicle respectively; (b) Lamp should be placed at the rear, or, in case of vehicles carrying loads projecting more than 6ft. to the rear, at the rear of the load; or, instead of red rear lamps the A.C.U. suggests reflex lights properly designed and approved by the Home Office for solo motor bicycles or pedal cycles.

As regards lighting-up time, the permanent enactment of "summer time" would be heartily welcomed by motor cyclists.

The Auto Cycle Union recommends that no vehicle be allowed to display more than two head lamps as distinct from or as incorporating the two side lamps which indicate the width of the vehicle.

That it should be an offence for any vehicle to remain stationary during the period in which lamps must be lit unless on the near or left-hand side of the highway relatively to direction in which it is facing.

The Auto Cycle Union recommends that the Lights (Driving of Animal Order) October 11th, 1916, be permanently adopted, but amended by the substitution of a red light for the white light prescribed in the said Order.

EFFECT OF WHEEL SIZE ON ROAD SHOCKS.

Some Advantages of Large Wheels Simply Explained.

By H. George Harley.

THE subject of wheel sizes in connection with shocks is bound to be of exceptional interest in these days of bad roads and startling developments in design. So much attention is now being given to springing and shock absorbing devices that motorists are beginning to look a little deeper into all matters connected with road shock, and, in fact, a little controversy springs up now and again about the size of wheels. These little discussions are not entirely novel, as there has always been, in the motor cycle field, for instance, difference of opinion regarding the merits of 28in. wheels, such as supplied upon many American machines, and the more usual 26in. wheels.

The object of the present article is to discuss, with the aid of a few diagrams, the effect of various wheel sizes when running over rough roads.

At the beginning it will be well to analyse the action of the wheels when a motor cycle is travelling over a "humpy" road.

There is more advantage in large wheels than first meets the eye of the casual observer, who is apt to conclude that the distance a wheel will drop into a pot-hole is the only test of wheel size which can be applied. The effect that wheels of different sizes have upon the force required to drive a motor cycle over a rough surface is, however, still more important.

Road Effects with Standard Wheels.

Fig. 1 is a diagram showing the road surface *a* containing a medium sized hole *b* in which the wheel *w* is able to run a short distance, with contact between the bottom of the hole and the lowermost part of the wheel existing all the time. Now, in this case, any point *p* on the wheel, supposing it is in contact with the road, tends to describe a cycloidal curve, shown dotted, provided that the wheel is running on a surface which keeps the wheel continually revolving, and this action, when the wheel runs into a slight hollow, is only varied to an extent depending upon the dimensions and shape of the hollow.

The case is a little different, however, when the hole has a sharply defined edge as at *q*, the wheel in this case rotating as above described until the centre is over the edge of the hole on the line *l*, assuming that the road is perfectly flat and level in front of the hole. When the wheel reaches this position, however, the point *p*, which is now considered as being resting upon the edge of the hole, ceases to describe the curve as previously described, but remains motionless while the centre of the wheel *c* describes an arc *s* which connects the line *l* with the line *m*, and this is normal to the first stretch of effective surface encountered by the wheel inside the hole. The wheel centre having reached the line *m*, the point *p* leaves the point *q* and describes a curve depending in shape upon the dimensions and shape of the hole as previously stated. Now these actions of the wheel are important as they determine the shape of the line *d* described by the centre of the wheel, and it is the shape of this line between the points *l* and *n* that determines the kind and intensity of the shock received by the vehicle through the springs.

Fig. 2 shows a little worse case, which is applicable to a discussion on the effects of "pot-holes." In this case the hole is deep and small in diameter, and the wheel is not able to bear effectively upon the bottom of the hole. The wheel runs along until its centre *c* reaches the line *l*, when the point *p* remains stationary upon the point *q*, and the wheel centre *c* describes the arc *s*. The important difference between this case and the previous case is that the hole is so narrow that the rim of the wheel touches the opposite side at *c* before the wheel centre *c* is able to reach the line *m*, the arc *s* thus stopping short at the line *o*.

It will be obvious that the rim the moment it touches at the point *e* ceases to bear at the point *q* and the wheel instantly commences to lift out of the hole, the wheel centre describing the arc s_1; the difference between the case in fig. 1 and the case in fig. 2, as regards the shock at *x*, is very obvious. In fig. 1 the point *x* is approached on a gradually reducing curve, while in fig. 2 the curve is rapidly increasing and changes instantly at *x* to a path which is in a totally different direction. The jerk that would result when the wheel centre reached *x* in fig. 2 may easily be imagined.

We may now commence to examine the effects of increasing the wheel size by means of the diagram, fig. 3, which shows a hole *b* exactly identical with the one

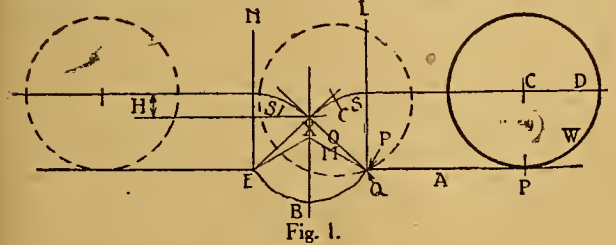


Fig. 1.

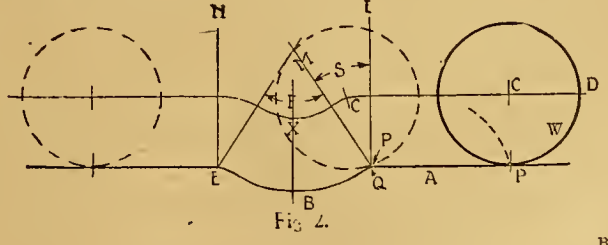

Fig. 2.

Effect of Wheel Size on Road Shocks.—

in fig. 2: while the wheel is approximately twice the size, the enormous difference in wheel size is, of course, only used for the sake of making the effects clearer. The big wheel will be seen to have the effect of reducing the distance *h*. that is, the distance which the wheel drops into the hole, by a considerable amount. The improvement does not stop at that, however, for not only does the wheel lift through a smaller distance, but it is spread over the same period of horizontal distance and, therefore, time, and, in addition to this, the parts of the arcs *s* and s_1, which are taken away, are taken away from the arc at the end which has the greatest shocking effect.

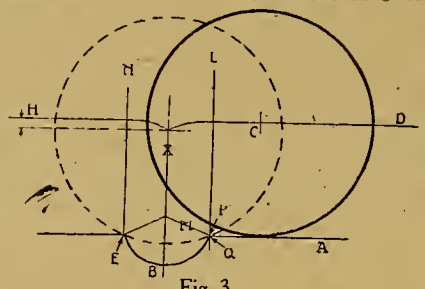

Fig. 3.

Fig. 4 shows a still smaller wheel travelling over the same sized hole. The curve may at first glance seem to be much better shaped at *x*, but a closer examination will show that, for all practical purposes, the defects previously encountered at the point *x* have now to be encountered at the point *y*.

Relations between Wheel Sizes and Forces Applied.

It is now desirable to discuss the effect of wheel size in proportioning the forces which are brought into play when a wheel is running over an irregular surface. These forces comprise the force caused by the vehicle trying to travel in a horizontal direction and the force caused by the obstruction trying to lift the wheel. It will be clear that as the wheel must travel over the obstruction, it must be lifted over by the force that is being applied in a horizontal direction. Having got so far, we can now turn to fig. 5. It will be clear from the foregoing that the wheel centre *c* will try to describe an arc *s* about the point *q*, and, as the pivot is thus at *q* and the weight of the vehicle is applied in a downward direction at *c*, the weight of the vehicle must be applying a force in pound-feet which is equal to the weight on the wheel multiplied by the length of *j* in feet. It seems necessary to explain here, for the benefit of non-technical readers, that one pound-foot is the unit of force for forces acting upon a lever or similar mechanism, and equals a force of one pound acting at the end of a lever one foot long. Therefore, if the weight *w*, fig. 5, was two hundred pounds and the length *j* was one foot, then the force tending to rotate the centre *c* about the point *q* would be two hundred pound-feet. Now it will be easily understood that this force must be overcome in order to lift the wheel centre through the arc *s*, and the intensity of the horizontal force *v* required to do this may be found by a similar method of treatment. The length of arm *k* of the horizontal force is measured as shown in the figure, that is, from the height of the line *j* to the wheel centre *c*. Now, if the length of *k* were equal to the length of *j*, the horizontal force *v* required at *c* would be equal to the weight *w*: if the length of *k* be longer than *j*, then the force *v* required at *c* would be less in proportion to the increased length.

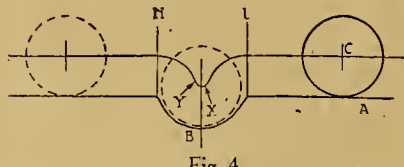

Fig. 4

To come back to the example previously explained; assuming that *w* is two hundred pounds and *j* is one foot, then the vertical force required to lift the centre *c* would be two hundred foot-pounds. If the length of *k* were also one foot the force *v* would also have to be, neglecting mechanical efficiency, two hundred pounds; if the length of *k* were, say, two feet, the force *v* required would only be one hundred pounds, while if the length of *k* were only six inches the force required would be four hundred pounds. It is necessary to understand these points clearly in order properly to follow the next points to be explained; and it may now be safely stated that, in the case of a wheel travelling over an obstruction such as shown in fig. 5 having a sharp edge, the force *v* required to lift the wheel against the weight of the vehicle and load is inversely proportional to the length of the arm *k*. The portion of fig. 5 which shows the smaller wheel will illustrate the effect of reduced wheel size if examined with regard to the points previously outlined.

Owing to the geometrical properties of the circle, however, points such as those previously explained are difficult to discover to the non-technical student on account of the difficulty of isolating any one point of research from the others. For these reasons it is necessary to examine fig. 6 carefully at this stage in order to discover just by what amount the length of *k* is greater in the case of *b* than in the case of *a*; the length of *j* is also greater, and, if the increase of *j* were directly proportional to the increase of *k*, there would be no advantage in the increased size of the wheel in *b*. As it happens, however, the increase of *k* with the larger wheel is very much greater proportionately than the increase of *j*—for instance, with the sizes drawn with wheel *a*, the proportion of *k* to *j* is as .75 is to 1, while with steel *b* the proportion of *k* to *j* is as 1.4 to 1.

It is now to be assumed that the weight *w* in both cases equals two hundred pounds, and if, for the sake of the comparison, we neglect the fact that the centre *c* travels up a kind of inclined plane instead of in a purely vertical direction (neglecting this point in no way affects the truth of the principle nor the proportion of the figures, but only their numerical value), we now know that with wheel *a* the force *v* required to lift the weight *w* over the obstruction is 266 lb., while in the case of wheel *b* the force *v* required is approximately only 140 lb.

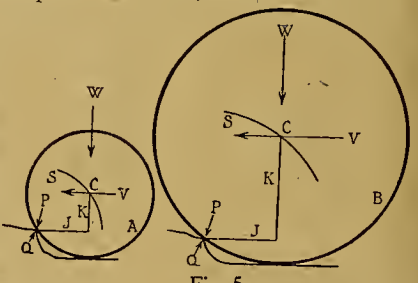

Fig. 5.

Action of Tractive Force when Meeting Bad Surfaces.

The effect of the obstruction upon a motor cycle is briefly as follows: The machine has a certain hori-

Effect of Wheel Size on Road Shocks.—

zontal or tractive force caused by the engine and the stored up energy due to the weight of the moving vehicle, and when it reaches an obstruction such as above described, this tractive force is suddenly reduced by an amount equal to the force required to overcome the obstruction; the cycle is also to all intents and purposes struck from beneath by a force equal to the force that would be given out by the weight falling a distance equal to the height of the obstruction and at the same rate as the cycle is travelling up the obstruction.

Obviously, then, if the length of *j* be greater as it certainly is with a larger wheel, then the rate at which the obstruction throws the cycle upwards is proportionately slower, and also if the length of *k* be greater, which is also the case with a larger wheel, then the reduction in tractive effort, due to the obstruction, is proportionately smaller.

The disparity of wheel sizes, however, such as shown in the accompanying figures, could not, of course, be allowed in actual practice, as it is obviously impractical at the present time to double the size of motor vehicle wheels. Enough has been said, however, to allow the motor cyclist who is interested in the problem of wheel size to study the matter with an intelligent appreciation of the results to be expected from small increases in wheel size and to allow him to consider whether it is possible to gain still a little more appreciable increase in shock-absorbing efficiency by increasing wheel sizes as much as the apparently everlasting problem of compromise will admit.

On the Road with a 1920 T.T. Norton.

A Fast and Flexible Solo Mount. Smooth Transmission with All-chain Drive.

FOR the past three months I have done most of my riding on a post-war model of the T.T. Norton, which is to be retained without further alteration for 1920. This famous machine has long been at the top of the tree in its class, and though it has yet to win the T.T., its Brooklands record is probably unsurpassed, and it enjoys a unique vogue amongst speed-loving roadmen.

The principal impression which it has made upon me is one of power. If there is a heftier 3½ h.p. on the roads of any country, I should like to meet it. On the level it accelerates from a crawl to the sort of pace which is often talked of but seldom experienced outside Brooklands: it is a mount which a sensible rider will very seldom dare to open out to the full on the road. Uphill its second gear is more than sufficient for any hill at which a run is obtainable; indeed, it should be handled with caution even on single-figure gradients, which it can devour at the most ferocious gait on full throttle. Bottom gear is never necessary except when a very rough surface or a very sharp corner suggests extreme caution in the matter of pace. On the other hand, the machine is as docile as a lightweight. The arc of the throttle opening is long, and the acceleration is smooth and gradual; if a firm forefinger is kept on the throttle lever, the machine will burble along like a sucking dove, and a raw novice will find it controllable in thick city traffic.

A Smooth Chain Drive.

The second merit of the design is the quite extraordinary smoothness of the chain drive. Many experienced riders still hold that chain drive is necessarily harsh behind a single-cylinder engine, and especially behind a power unit of the T.T. type with a high compression ratio and big ignition advance. Half an hour on the new Norton would disabuse them. It is no exaggeration to say that the 1920 Norton chain drive is as smooth as any belt has ever been, and—until the chains and sprockets show signs of appreciable wear—quite as silent; the only perceptible noise is the faint hum of the gear box. It shows an immense advance over the chain drives of pre-war days, an advance which I believe to be characteristic of most high-class modern productions. Nobody could yearn to revive the belt after a taste of this quality, and I do not wonder that Mr. Norton has scrapped the belt on all but his track models.

Criticisms.

During prolonged hard work of a ruthless character, combined with the negligent upkeep to which most journalists' machines are foredoomed, the machine has shown great reliability. No misfires, engine stoppages, or transmission troubles of any kind have been experienced. Two nuts have evinced a disinclination to remain in position, namely, the nut on the off side of the brake pedal spindle, and the nut securing the off side struts of the carrier to the rear fork lug: the former is rather a serious mishap, if unobserved. One part may be regarded as weak either in design or material, according to one's standpoint. The exhaust valve tappet is lifted for control purposes by a lever pivoted to a crank case bolt; the eye at the end of this arm is slotted to facilitate fitting the Bowden wire. The lever is apt to crack across the slotted eye; and a new lever cannot be fitted without dismantling the exhaust valve.

ROAD RIDER.

The first lady member of the Cardiff Motor Cycle Club, Mrs. R. B. Williams, on her Levis two-stroke. The Cardiff M.C.C. intend catering especially for lady motor cyclists, and a special section is being formed for them.

A New Engine for Runabouts.

The Novelette Cycle Car Engine of 1,100 c.c. made by a Well-known Aircraft Engine Firm.

IT is fairly well known that there is a shortage of engines suitable for runabouts and cycle cars. Motor cycle engines of a large capacity are being employed with success; the question of supply, however, necessitates an increased output, and the British Anzani Engine Co., Ltd., realising this, have made preparations to produce both water and air-cooled power units which will be designed expressly for cycle cars. Although the general design of the engine follows standard practice, a suggestion of aircraft construction can be clearly seen in some of the principal features.

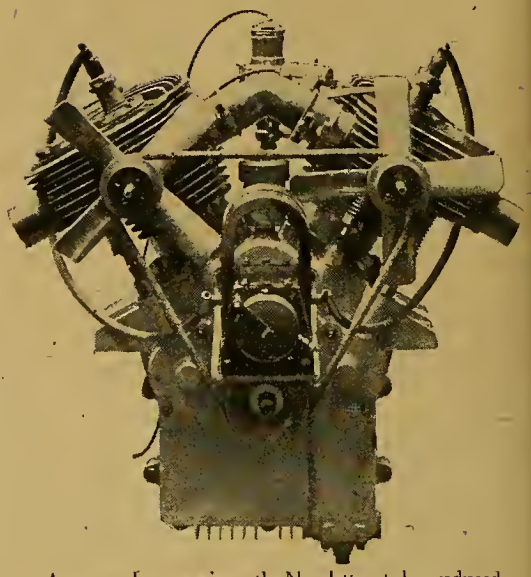
The flywheel is located at the rear of the crank case in the Novelette engine of 1,100 c.c.

Two cylinders, having a bore and stroke of 85×95 mm., 1,100 c.c., set at an angle of 57°, are bolted to an exceptionally large crank case. The flywheel is located at the rear of the crank case in order that it may be used for accommodating the clutch. An efficient system of lubrication embodies a mechanical plunger pump, driven from an eccentric disc on the half-time camshaft, the oil being circulated to the main engine bearings. The hollow balanced crankshaft is drilled in order that the oil may flow to the big end, the residue from which lubricates the cylinder walls, piston, and gudgeon pin by splash. Sufficient oil for 300 miles is carried in the sump.

Aero engine practice is employed in the construction of the cast iron piston, which, although fitted with two rings, is of very shallow depth. Considerable attention has been paid to the efficient heat distribution, and the cylinder casting on the air-cooled model has been designed to permit a cool draught of air being circulated completely round the exhaust valve pockets. To assist in the cooling of the cylinders two fans are mounted on lugs cast integral with the cylinders, and driven from an external pulley fixed to the front end of the crankshaft. The draught-producing end of the blades passes directly across the exhaust valve pocket of each cylinder and so forces cool air between both inlet and exhaust pockets.

The valve gear is of the conventional type, the four valves, which are fitted with adjustable tappets, being driven through the media of rockers from a single cam wheel mounted directly above and driven from the crankshaft. An M-L magneto is bolted to a platform cast integral with the crank case, and is driven directly from the camshaft, and protruding from the fan pulley is a fitment provided for the accommodation of the starting handle.

Quantity production is under consideration by the makers, and it is hoped that a number exceeding 20,000 engines will be the product of next year's programme. These engines will be handled in London by Mr. J. W. Smith, 29, Red Lion Square, Holborn, London, W.C.1., to whom enquiries should be addressed.



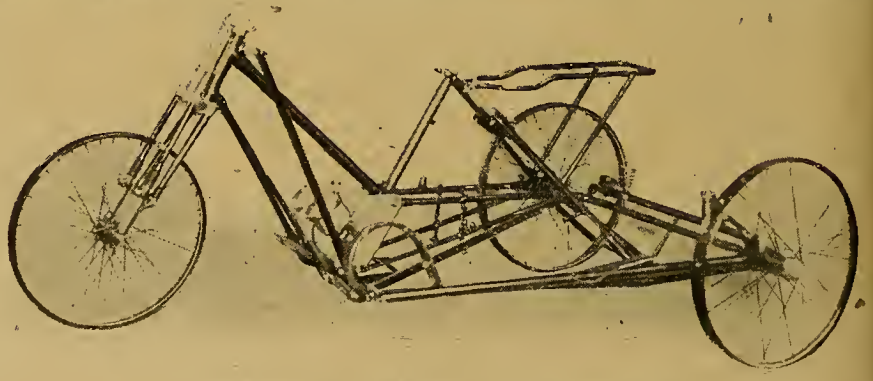
A new cycle car engine—the Novelette—to be produced on a quantity basis. Mechanical lubrication is adopted, the sump holding sufficient oil for a 300 miles journey.

Triangulated Construction.

Straight Tubes and a Complete System of Triangulation used throughout the Frame and Chassis of the Scott Outfit.

AN interesting item in the exhibit of the Scott Motor Cycle Co., Ltd., at the recent Olympia Show was a complete motor cycle frame and sidecar chassis stripped to enable the lines of the general construction to be readily appreciated. It will be noted that the design is such that the motor cycle frame itself, as also the chassis, consists of a series of triangles. Furthermore, the frame and chassis, considered in relation to each other, also form a triangulated system. All the triangles are perfect except those having their apices at the steering head, which truncates the main vertical triangle of the frame. It will be observed that the engine gives rigidity to the central portion of the frame, forming as it does the base of the main members; at the same time it does not form a link between any entirely separate parts of the frame.

Another point of interest is the fact that the oil supply is carried in the two large frame tubes.



Stripped frame and chassis of the 1920 Scott sidecar outfit.

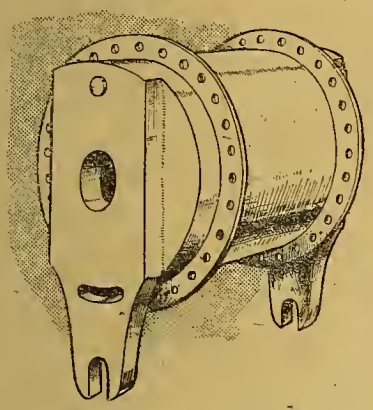
The sidecar springing is effected by an inverted laminated C spring at the front and a rocking link at the rear controlled by two coil springs in tension. Small shock-absorbing springs in compression support the body on the cross bar.

RECENT PATENTS.

REVIEWED BY B. H. DAVIES.

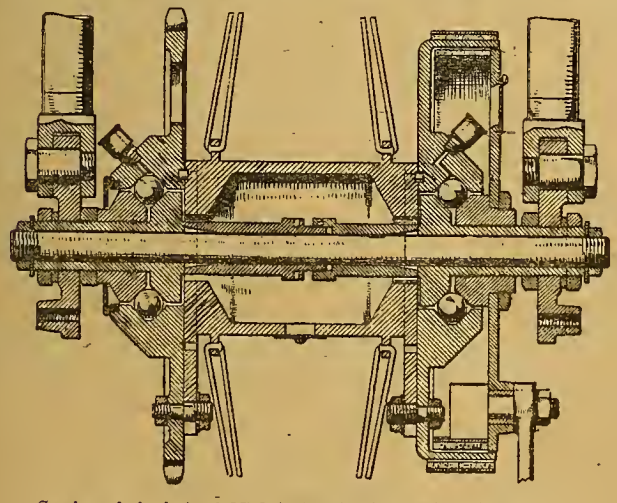
A Detachable Wheel.

MR. D. L. HICKS, of Long Island, has hit upon quite a nice dodge for detachable wheels of the knock-out spindle type. The driving sprocket and brake drum are carried on ball bearings upon sleeves secured to the frame. The



Hub exterior of Hicks's detachable wheel.

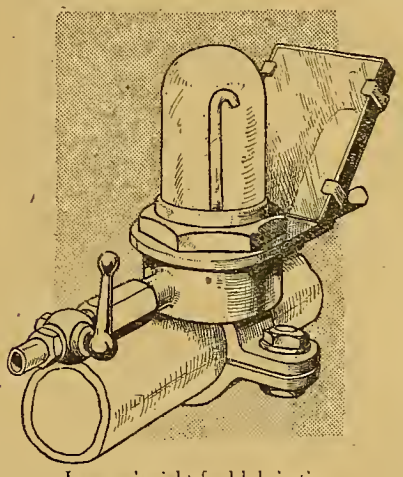
sketch shows how the wheel hub attached to these two members is centred by small dowel pins and locked in position by bolts passed through the forked extensions. An ingenious detail is the adjustment of the ball bearings on which the sprocket and brake drum rotate. The outer cone in each case is fixed. The inner cones are pushed outwards by the double sleeve "spreader" shown in the middle of the sectional drawing. This spreader is adjustable by means of a tool inserted through a slide in the hub barrel.



Section of the hub of Hicks's detachable wheel. No. 126,211. 11/7/18. (Fig. 2.)

A Sight-feed Improvement.

The late Mr. R. J. Isaacson had noticed that it is often rather difficult for a motor cyclist to get a satisfactory view of the oil dripping through the sight feed glasses fitted to motor cycles. He proposed to fit a small tilted mirror behind the glass dome, so that the rider could watch the drip without getting a stiff neck. Unfortunately, this landable object may often be checkmated by oil clinging to the surface of the



Isaacson's sight feed lubrication. No. 126,203. 27/6/18.

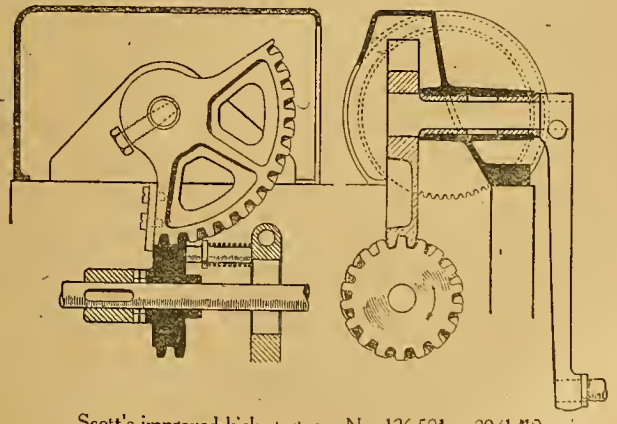
dome. Possibly, this would be less likely to occur if the patentee had adopted a circuit in which the mechanical pump sucked oil out of the glass, in lieu of pumping oil into the glass; as the mirror is the heart of the patent, such a modification is quite permissible.

"Roll Top" Sidecar Locker.

As a haughty motor cyclist, I am bound to resent the preamble to Mr. H. J. W. Dunn's patent, "Improvements in the Bodies of Sidecars, Perambulators, or the like"; perhaps my indignation is pedantic, since many modern owners treat their sidecars as perambulators. Anyhow, Mr. Dunn proposes to extend the sides of the car to the rear of the seat in a graceful semi-circular sweep, and to close the roomy locker thus provided by means of the wooden blinds familiar on rolltop desks. If desired, a pull-out drawer is fitted in the base of the locker; and this drawer may be arranged for use as a grid to carry extra luggage. Sidecar weddings are already common; the next step will be furniture removal by sidecar. An ingenious and convenient body, despite my jests.

Positive Kick-starter Engagement.

There is a certain amount of difficulty in providing a foot-starter on engines, notably four cylinder motors, which have their crankshafts in line with the frame. In most kick-starters the pedal swings in a plane at right angles to the axis of the shaft which has to be rotated. Mr. A. A. Scott has protected the device illustrated herewith for imparting motion to a crankshaft set in line with the wheelbase. When the pedal is kicked, the toothed quadrant immediately forces a ratchet cut on one face of a loose worm on to another secured to the shaft, and the further motion of the pedal consequently spins the shaft. A small coiled spring assists the meshing of the ratchet, and a plate bolted to the farther end of the toothed quadrant ensures the disengagement of the ratchet. The device is plainly both strong and simple. I wonder if it is to figure on the Scott Sociable?



Scott's improved kick-starter. No. 126,591. 29/1/19.

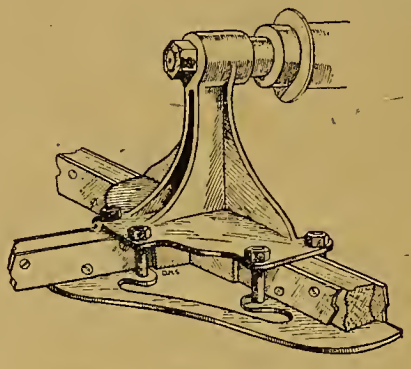
A Strong and Light Chassis Construction.

The R.V. Sidecar. Wooden Members, Stiffened with Steel Flitch-plates, Readily Assembled without Brazing or Welding.

WE have frequently urged, and trials and the experience of war service have given weight to our contention, that the secret of successful sidecar design lay rather in the embodiment of inherent flexibility than in the manufacture of an ultra-rigid structure, with a multiplicity of connections between it and the motor cycle.

Only to refer back to so recent an event as the Six Days Trials, we find that a sidecar with only two points of attachment came through with flying colours, while others, more rigidly fitted, collapsed under the vibration and bumping experienced on the rough and mountainous roads.

The same lessons were learned during the war in the heavy lorry industry, and those trucks which possessed chassis built of materials naturally resilient were found to give much longer service than those having stiff and rigid framework.



One of the lugs in which the wooden chassis members are secured by bolts and plates in the box-like junctions. This one supports the wheel hub

size, anyone can erect the chassis, which is a great consideration when export trade has to be considered.

Suspension of the body is effected by the usual C springs at the rear and a double-shackled transverse spring in front. The chassis is extremely light, despite its great strength, and can easily be lifted with one hand.

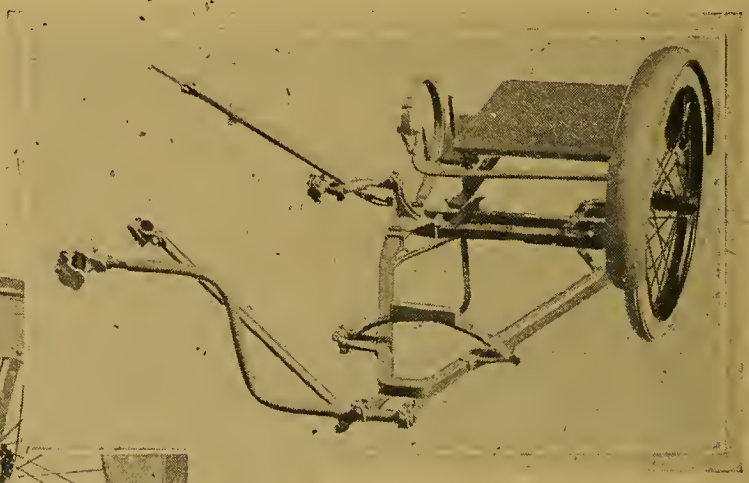
As an extra fitting a commodious spring luggage platform and petrol tin carrier is fitted at the rear on detachable cantilever extensions which are fixed parallel to the chassis side members. This luggage grid can also be supplied to fit most standard makes of sidecar chassis.

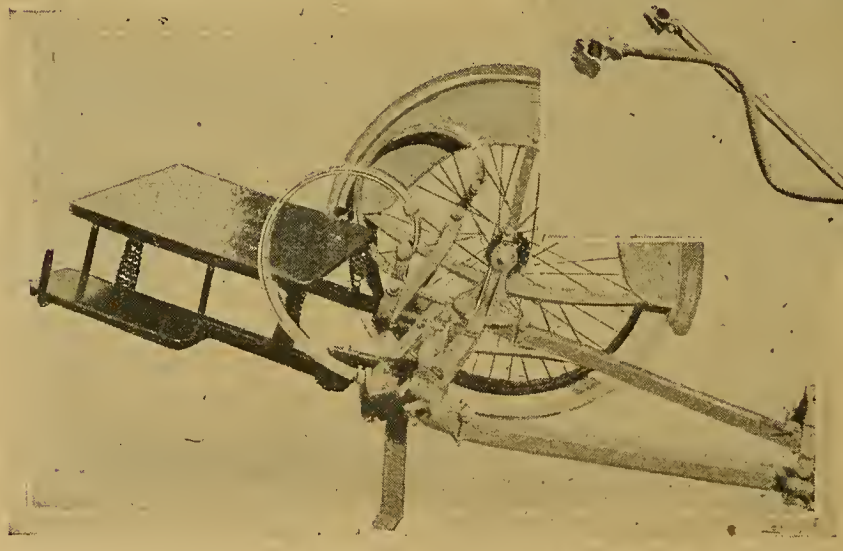
The price of the R.V. chassis will be in the neighbourhood of £12, or, as a complete coachbuilt sidecar, £22; the luggage grid will cost £2 5s. extra. Arrangements are being made for the production of the sidecars in large quantities.

A NON-TUBULAR SIDECAR CHASSIS.

(Left) A spring luggage and petrol can carrier fitted to the R.V. sidecar, and adaptable to any standard make of chassis.

(Right) The R.V. sidecar chassis. No brazing or tubes are employed, the main members being constructed of ash, between light steel flitch plates, bolted into interchangeable junction lugs.





We have now under review a chassis which will accommodate any type of sidecar body and which may yet claim to be unique. Its design is the work of Mr. H. S. Harvey, of the R.V. Sidecar Co., 92, Humber Avenue, Coventry, and it is so arranged that a practically unbreakable framework is secured. The main chassis members are of rectangular section ash, strengthened on each side by continuous strips of thin steel. In plan, the chassis presents the view of a truncated triangle, with the apex forward, and the connections at this point and also the cross-members at the rear are bolted together in stiff malleable-cast lugs.

The lugs at the rear support the wheel stub axle and the chain stay connection, and have box-like junctions, into which the side and cross-members fit snugly. Stiffening plates also are fitted across the angles. It will be seen that as no brazing is employed, all the main defects of tubular chassis construction are eliminated; moreover, as the whole of the parts are interchangeable and assembled with bolts and nuts of uniform

PRE-IGNITION.

ON a recent occasion we were trying a 4 h.p. single-cylinder sidecar outfit, which ran quite satisfactorily with the sidecar empty, but as soon as a passenger was carried and the load increased, pre-ignition set in, and the machine refused to climb quite a slight hill. The usual symptoms were experienced; persistent knocking, followed by the engine immediately "konking out." After a few minutes' rest the engine would start again, until the symptoms recurred. At the very next opportunity we removed the plug, which appeared to be sound except for some minute cracks round the base of the insulating material, and replaced it with an orange-coloured K.L.G. plug, of the type recently discarded by its makers. As soon as the new plug was inserted a very marked improvement was noticeable, and all signs of pre-ignition ceased. This is very curious, as the original plug was of such a design that pre-ignition would not be thought possible.

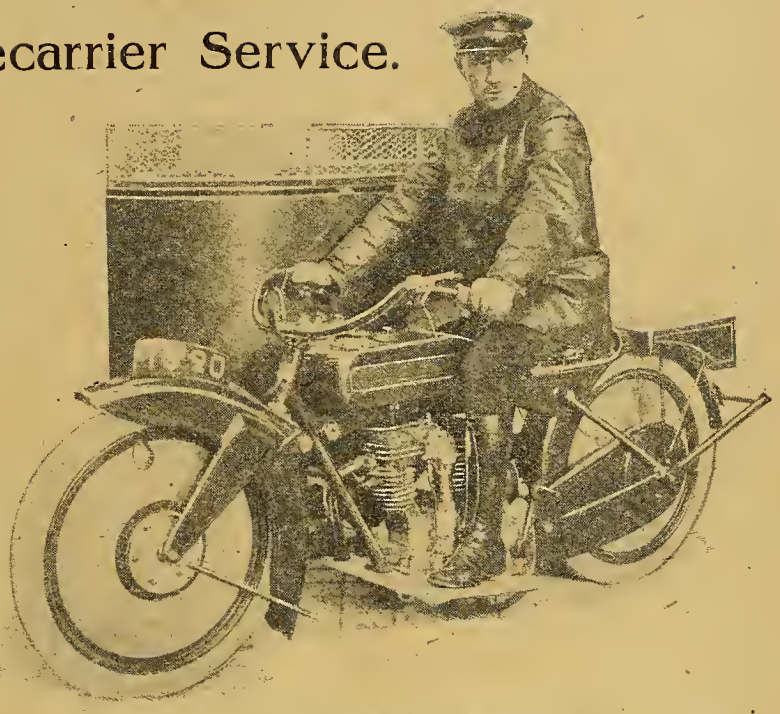
A French Sidecarrier Service.

Scheme to Employ 150 Motor Cycles for Parcel Delivery in Paris.

WITHIN a few days Paris will have a motor cycle parcels van delivery service. The idea originated among a group of French Flying Corps officers, who realised that there was need in Paris for quick motor delivery vehicles which would be as fast as the motor van whilst being considerably lower in cost.

According to the officials of the company which is inaugurating the service, a contract has been secured to undertake the delivery of all the Paris newspapers from the printing offices to the railroad stations and to the kiosks scattered about the city. In addition to this, it is intended to let the motor cycle delivery vans out on hire to the big departmental stores.

For a fixed charge of fifty francs a day the company will supply the vehicles, complete with driver, petrol, oil, etc., and will assume all responsibility as regards accidents, theft, etc. The mileage is fixed at fifty kilometres (thirty-one miles) per day, an extra charge being made for each kilometre above the fiftieth. At nominal rates of exchange, this would be equivalent to rather less than £2 per day for a maximum mileage of thirty-one. With the rate of exchange as it stands at present, the charge is only equal to 25s. per day. The company states that it not only will provide motor drivers, but responsible men who will deliver parcels and collect payment on them, according to the practice very commonly adopted in Paris. In all cases where horse vans are employed, two men have to be engaged, one driving the horse and the other delivering parcels and collecting accounts. In making a comparison, therefore, this extra cost of a delivery man should be taken into consideration. Whenever a business house engages ten or more machines, a skilled mechanic will be sent for each ten machines to remain entirely at the disposal of the company.



One of the types of sidecarriers which will be used by the Paris parcel delivery service. A pressed steel-framed Louis Clement with overhead camshaft—a most advanced design

British Machines Selected.

Various makes of machines have been selected for this work. The first to be used will be fifty B.S.A.'s. These will be augmented by sixty Louis Clement twin-cylinder machines, and by fifty French-built A.B.C.'s. All the machines will be fitted with the detachable disc wheel as used on the standard Louis Clement motor cycle. These wheels are interchangeable throughout. The delivery van is placed on the right-hand side, and is designed to carry a load of about 1⅖ cwt.

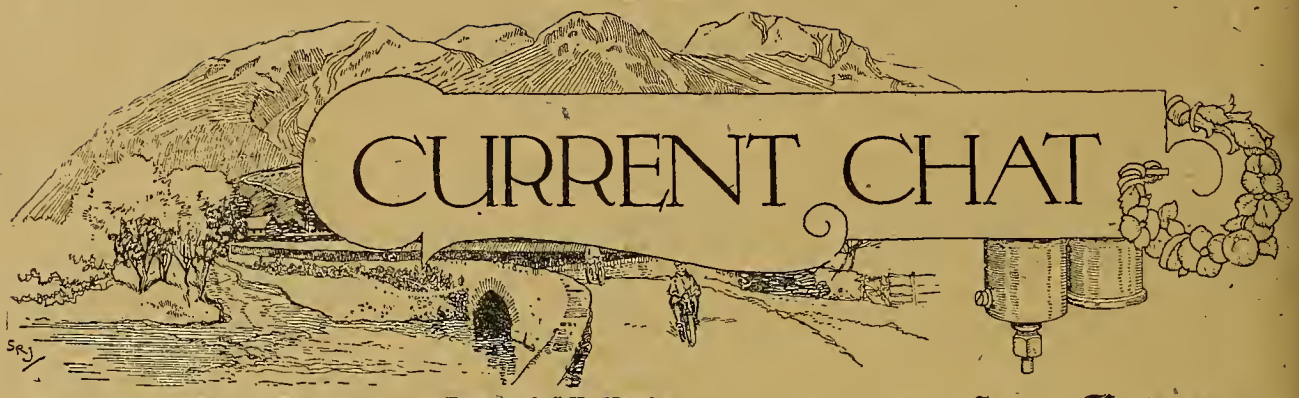
Opportunity for Ex-army Drivers.

It is not expected that there will be any difficulty in securing suitable drivers for these machines. Already there is a big waiting list, among them being many men who served as despatch riders in the French Army. The drivers will be paid twenty francs per day, plus a bonus of two francs for each day without accident or mechanical breakdown.

It is worth noting that the attempt to put motor cycle taxis on the streets of Paris seems to have been a failure. One of these machines made its appearance and then disappeared to be followed by no others. The French public did not appear to be attracted by the idea of travelling in a sidecar, even though the price was considerably below the charges for an ordinary taxi. This delivery scheme, however, looks more promising, and no doubt such a service would meet with a certain measure of success in this country.

Mr. J. L. Norton, the designer of the "Big Four" bearing his name, in giving his impressions of the recent Show to our trade contemporary *The Motor Cycle and Cycle Trader*, stated that he regretted the general trend of design was not more in the direction of simplicity. Apart from the little two-strokes, Mr. Norton considers that there appeared to be a tendency to over-develop and over-elaborate the motor cycle and sidecar outfit. "I should have liked to have seen," he said, "a real lightweight motor cycle, but did not."

Mr. Norton evidently had in mind a little two-stroke-engined lightweight, which he made experimentally some ten years ago, and which weighed just under 56 lb. We also should like to see a revival of this type of machine on up-to-date lines.



CURRENT CHAT

Times to Light Lamps.

GREENWICH TIME.

Dec.	18th	... ...	4.20 p.m.
,,	20th	... ...	4.21 ,,
,,	22nd	.. ...	4.21 ,,
,,	24th	... ...	4.23 ,,

Christmas.

Next week's issue will be dated December 25th, and the principal features will be of a seasonable character.

Cable Suspension.

A most ingenious system of springing is described in *The Autocar* of December 13th. All four wheels are sprung by means of a single coil spring acting through cables. The springing is instantly variable to suit the load, and automatically incorporates an anti-rolling device. A modification of the design might be made applicable to motor cycle suspension.

Smuggling a Motor Cycle.

The chief electrician of the White Star liner *Celtic* was recently fined £100 for smuggling into the country and selling a foreign motor cycle. This is the first case on record of an attempt to avoid the payment of the 33⅓% import duty on motor cycles. It was stated that £60 was paid for the machine in America, and £135 the price obtained for it in this country.

Imports and Exports.

Imports of motor cycles and accessories show nearly a 10% increase over last month's figures, the value of machines alone, apart from accessories, being £9,259.

IMPORTS.—NOVEMBER.

	1917	1918	1919
Number of motor cycles	—	—	134
Value of motor cycles, parts and accessories	£2,907	£491	£17,840

EXPORTS.

November figures show an increase over the previous month of £12,000. It is satisfactory to note an improvement, but the amount is comparatively trifling. The total export figures, which include tyres, accessories, parts, are £115,035, actually £38,572 less than the figures for the corresponding month of 1917, when we were in the thick of the war. Many factors exist which mitigate against big exports, but even so there is room for a considerable improvement.

	1917	1918	1919
Number of motor cycles	1,594	493	838
Value of motor cycles, parts and accessories	£155,607	£49,601	£115,035

Free to A.C.U. Members.

The Auto-Cycle Union has designed an artistic addition to the badge supplied to members for fitting to their machines. This takes the form of a tab bearing the figures "1920/21," and will be supplied free to all members. The tab will, of course, be replaced each year when members renew their subscription, and its colour will be altered on each occasion so as readily to proclaim the currency of the badge. The Union is now also issuing a unique universal clip by means of which the badge may be easily fitted to a mudguard, number plate, lamp, or to the sidecar. Those members desiring to fit the badge to their handlebars are supplied with a special form of clip for that purpose.

World's Records.

The Automobile Club of Switzerland has asked the Fédération Internationale des Clubs Motocyclistes to accept the following as world's records. It will be noted that the greater part of the times are not equal to the British record times for the same distance, but those which the A.C. of Switzerland want accepting were made under a rule of the F.I.C.M. for world's speed records, where the aggregate of the outward and homeward journeys is taken, the one being against the wind and the other with it, whereas the comparative British records were made on a straightaway course, or a circular track. The following are the Swiss flying kilometre records that the F.I.C.M. are asked to accept:

The first time is the outward, and the second the return journey.

MOTOR BICYCLES.

250 c.c.—Alfter (Condor), 39s., 34s.; average 36.5s. = 98.6 kilometres an hour.

350 c.c.—Progin (Motosacoche), 33s., 32⅘s.; average 32.8s. = 109.75 kilometres an hour.

500 c.c.—Lavanchy (Motosacoche), 30⅘s., 27⅗s; average 28.9s. = 124.57 kilometres an hour.

SIDECARS.

500 c.c.—Gex (Motosacoche), 42⅖s., 39⅖s.; average 48.8s. = 88.225 kilometres an hour.

Special Features.

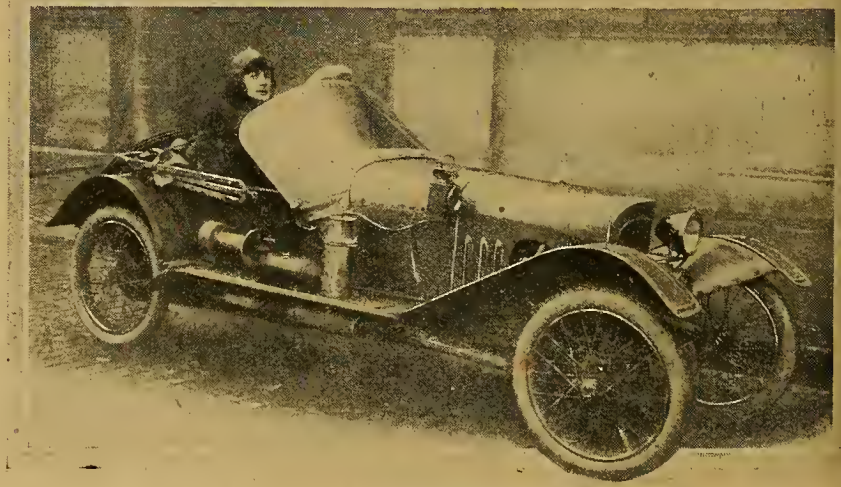
EFFECT OF WHEEL SIZE IN ROAD SHOCKS.
A MODERNISED VETERAN.
NEW IDEAS IN 1920 ENGINES.

The Circuit de la Sarthe.

There is some doubt if the Grand Prix of the Automobile Club de France will be run over the Circuit de la Sarthe. If, however, it is not possible to get support for the car event, it is likely that a motor cycle and cycle car race will be run over this course, such an event having been projected in 1914.

Rudge-Multi Prices.

The revised prices of Rudge Multis and sidecars from January 1st, 1920, will be as follows: 3½ h.p. Rudge Multi (roadster and T.T. model), £100; 5-6 h.p. Rudge Multi, £110; 7-9 h.p. Rudge Multwin, £130; and Rudge sidecar, £37 10s.



Rex G. Mundy on the G.N. cycle car at Edinburgh after driving from London to Edinburgh without stopping the engine, which was air-cooled

A Satisfactory First Year.

The first annual dinner of the Blaenavon M.C.C. was held on the 3rd inst., when 80 were present.

A French Reliability Trial.

The Touring Motor Club of France has decided to hold a Reliability Touring Trial on June 20th, from Paris to Cabourg. The secretary of this organisation is Monsieur Poulain, 4, Avenue de Villiers, Paris, and the annual subscription is 30 francs.

Vacuum Flasks and the London-Exeter.

Competitors will be glad to learn that in addition to the usual provision at the Bridge Hotel, Staines, Miss Dixon, of the Mikado Restaurant, near the hotel, is arranging to fill vacuum flasks with tea, coffee, cocoa, etc., and also for suppers.

Amalgamation of East Lancs. Clubs.

At the dinner of the Blackburn M.C.C. last week, Mr. S. W. Phillpott, of Liverpool, referred to a conference that had been held the same evening between officials of the Blackburn, Burnley, and Preston clubs with a view to amalgamating these clubs. This fusion of interests, we understand, is to take place immediately, when the North East Lancashire M.C.C., as it then will be called, should be in a very strong position to organise competitions.

Petrol Profiteering Committee.

Capt. R. H. Montgomery, head of the Fuel Department of the Automobile Association, also secretary of the Joint Fuels Committee, has been appointed to represent the Automobile Association on the Petrol Profiteering Committee.

Rochester Club's Successful Year.

The Rochester, Chatham and District M.C., which was revived at the early part of the year, have had a very successful season, and concluded the year's programme with a whist drive and dance last week.

Bristol-Land's End and Back Open Twenty-four Hours Trial.

Motor cyclists who wish to enter for the above trial should telegraph at once to Mr. Alan King Smith, Bitton, near Bristol.

We hear the Bridgwater-Porlock and Launceston section is in really good condition with the exception of a few loose stones on Woodstock Hill. One or two patches near Canterbury Gate will require careful negotiation, especially by the solo competitors.

The Launceston check is cancelled, but there will be one at Bodmin.

Refreshments free of charge are being provided at Porlock and Bodmin. Those desiring a meal before the start at 5 p.m. on the 26th should telegraph Full Moon Hotel, North Street, Bristol.

The London-Exeter Run.

This run was inaugurated in 1910, when seventy-eight entries were received, and consisted mainly of motor cycles. In 1911 the entries increased to 119, and the number of sidecars was greater than in the previous event. The 1912 event attracted 163 entries, and in 1913 no fewer than 231 numbers were issued. This year the total entry numbers forty solo riders, sixty-seven sidecars, and one car and one scooter.

The Surrey M.C.C. Crow Cup Trial Results.

A list of awards made in the above trial, which was run off on December 6th, is now to hand. Owing to the weather conditions, several of the hills were eliminated, the route markers finding them impassable. The course was somewhat arduous, but few failures were recorded on the hills, of which several were included in the day's run of 101 miles.

A flexibility trial was introduced in order to find a winner, and the following awards were made:

C. Charlesworth (5 Zenith), Crow challenge cup and silver medal.

F. P. Verney (4 Zenith), second, silver medal.

F. J. P. Disney (4 Zenith), third, bronze medal.

F. G. Meeten (4 Blackburne), bronze medal (non-stop).

— Gibson (— Zenith), bronze medal.

5,000 MILES OBSERVED TEST ON BENZOLE.

Summary of the Report on 4 h.p. Triumph, issued by the Automobile Association and Motor Union.

SOME interesting information is contained in the report of the 5,000 mile benzole test with a chain-driven Triumph, which was organised by the A.A. and M.U. to demonstrate that benzole had no deleterious effects on the engine and tank. In every way the test may be regarded as being highly successful, and removes once and for all the false impression which had existed in many minds that benzole caused corrosion and undue wear and tear.

Prior to the test being made, the engine, tank, carburetter, and fuel feed pipe were examined by Mr. R. S. Fox, appointed by the Institution of Automobile Engineers, and Capt. A. D. Allen, O.B.E., of the A.A. Engineering Department, and at 2,137 miles the engine was decarbonised by Mr. Fox, when the amount of carbon was found to be about 50% less than the average amount deposited when petrol is used.

On the completion of the 5,029 miles, a further examination was made by Mr. Fox and Capt. Allen, when it was found that the condition of the internal parts of the engine was excellent, the effects of wear and tear being in most cases almost negligible and in no case excessive, with the sole exception of the first of the four exhaust valves used.

The fuel tank was clean and bright inside, and in excellent condition. No signs of corrosion were discernible, and the presumption that the enamel round the filler cap on the outside of the tank would have been removed by the action of benzole did not materialise. The condition of the enamel was exceptionally good.

The carburetter used was the Triumph standard instrument, the only alteration being the fitting of an extension pipe, about 4in. long, on the air intake. The machine was driven throughout the whole of the trial by H. Finch, of the Triumph Co., the official observers being representatives of the various motor cycle clubs in the districts visited and the press, including *The Motor Cycle*. From the start of the test to 2,428 miles Mr. H. W. Bartlet represented the A.A., and from that point to the finish Mr. H. B. L. Smith officiated.

Throughout the entire test the same Lodge plug was used, and no record appears in the log book of the run of its ever having been cleaned. At 271 miles trouble was experienced with the magneto, due to a piece of insulating tape having caught the water and let some into the magneto. The tape was removed, and no further trouble was experienced.

When decarbonised at 2,200 miles the deposit was carefully collected and weighed, the carbon weighing 3.3 grammes, or 51 grains. At the conclusion of the test the amount of deposit was 4.4 grammes (68.2 grains). The total oil burnt during the test was 4 gallons 1 quart ½ pint.

Altogether the test has been most interesting, and the A.A. deserve the thanks of motor cyclists for giving such a conclusive proof of the merits of benzole. The Triumph Co., too, are to be congratulated upon the good performance put up by the machine.

THE TRIAL SUMMARISED.

The mean weight of the 4 h.p. Triumph and sidecar outfit complete was 7 cwt. 1 qr. 26 lb.

Total number of gallons used during the test, 59 gals. 7 pts.

Average mileage per gallon, 84.

Average ton mileage per gallon, 31·34.

Consumption of lubricating oil 4 gals. 2½ pts.

Average oil consumption, 1·166 m.p.g.

Average speed throughout the run, approximately 19·88 m.p.h.

Highest consumption, 67 m.p.g. over 105 miles.

Lowest consumption, 109·6 m.p.g. over 137·1 miles.

M.C.C. London-Exeter-London Christmas Run.

THE last "London-Exeter" attracted no fewer than 231 entrants, and while this figure has not been reached for the 1919 event, the entry of 110 may be regarded as very satisfactory. The start is from the Bridge Hotel, Staines, at 8 p.m., on Boxing Night, and the route outward will be *via* Bagshot, Basingstoke, Andover, Salisbury, Shaftesbury, Chard, and Honiton. The return journey will be *via* Trow Hill, Lyme Regis, Bridport, Dorchester, Salisbury, Basingstoke, etc., to Staines.

There will be a stop of one hour at Salisbury, both in the outward and homeward journeys. The two test hills, Chard and Trow, have to be ascended non-stop.

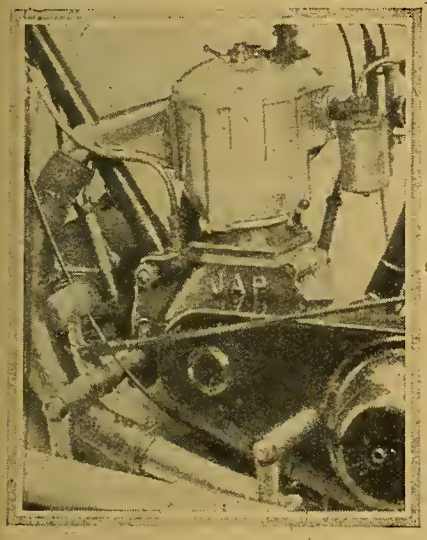
An Improvement in Air-cooling.

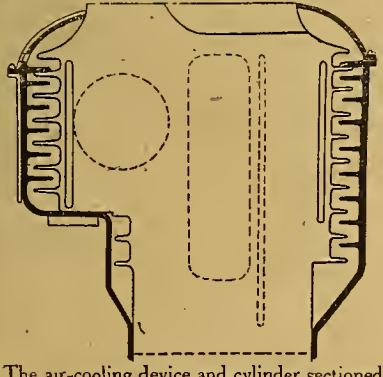
Completely Enclosed Air-cooled Engine, permitting Thorough Mud-guarding and Protection for the Rider.

ENGINEERS have at last begun to realise that there are other means of cooling by air than casting cylinders with fins thereon, and leaving the rest to chance. Air-cooling has been rendered more suitable for internal combustion engines by methods of constructing the engine; for instance, by the use of steel cylinders and aluminium pistons, and also by extraneous means, as in the case of the system we are about to describe.



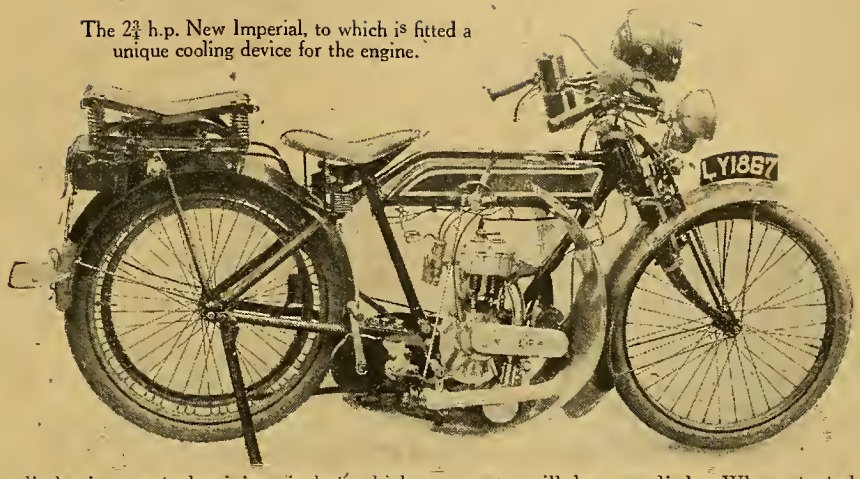
Showing the cast aluminium jacket, which totally encases the cylinder, but leaves the valve springs and caps accessible.

This ingenious idea has been brought out by Mr. Hawley Morgan, formerly a member of the staff of this journal. He has left nothing to chance, and has worked out the whole system most thoroughly. He entirely encloses the



The air-cooling device and cylinder sectioned to show air passages.

The 2¾ h.p. New Imperial, to which is fitted a unique cooling device for the engine.



cylinder in a cast aluminium jacket, which in no way interferes with the general design of the engine, as the same valve caps are retained, the valve springs are outside it, and everything is just as accessible as it was before. It is fitted to a 2¾ h.p. J.A.P. on a New Imperial machine.

With this system in use it is possible to enclose the front of the engine entirely by means of an aluminium mudshield, which would not be possible, of course, unless a special cooling device were incorporated. The jacket is made in two halves clamped together, while the head forms a separate portion. The existing silencer is retained, but it is provided with a small cone-shaped exit pipe. Connected to this there is an additional silencer or chamber in which there is a special ejector (giving about 6½in. vacuum) connected by a rubber hose pipe to the suction pipe on the aluminium casing. On the right of the slot to which the suction pipe is attached is a barrier of a diatherminous substance. In addition to the cylinder being provided with fins, there are also aluminium fins on the casing. Cool air is drawn in a continuous stream through the slots arranged round the casing, causing a current of air to pass through the fins not only on the sides of the cylinder, but also directly over the head, and this portion has been most carefully thought ont, as 75% of the heat in the cylinder is to be found in this portion.

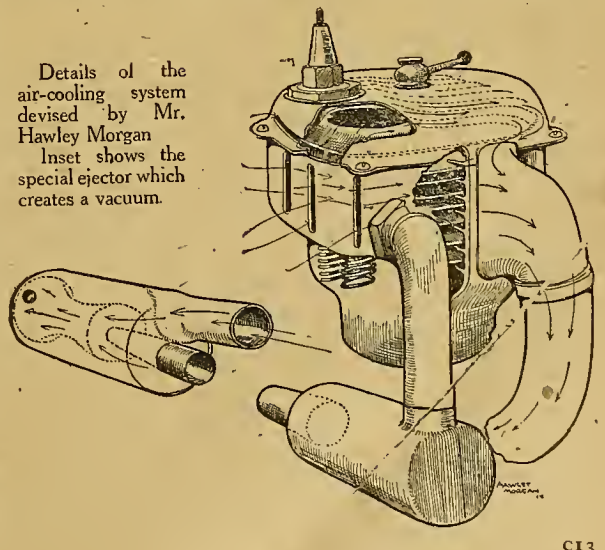
Detachable head showing ease of accessibility to valve caps.

This system has been beautifully installed on the experimental machine. It is well finished and attractive in appearance. The only fault developed so far is the ground clearance, which the shield has reduced to too great an extent, and this, of course, will be remedied. When started it is easy to see that a strong suction is developed, as it will even suck the ash off the end of a cigarette and draw it in. When the pipe is coupled up the flame from a match held near one of the slots is visibly drawn towards it.

We have not yet tried the machine on the road, but hope to do so shortly. With this cooling system, as we said before, it is quite possible to shield the engine entirely, with the result that the rider can travel through any road conditions without getting a speck of mud thrown up either on the engine or on himself.

IN GOOD COMPANY.

We learn that of the team of six machines entered by one firm in the forthcoming French Scooter Trial, three will be ridden by well-known actresses, and the others by a champion pugilist, a famous golfer, and a French "Ace." Since a correspondent recently complained that so far scooters appear to have been manufactured solely for the benefit of such notabilities as actresses, golfers, and journalists, and as the above list rather bears out his statement, we feel that at any rate we have been in good company.



Details of the air-cooling system devised by Mr. Hawley Morgan. Inset shows the special ejector which creates a vacuum.

Triumph of the Petrol Engine Made Manifest.

Half-way Round the World by Aeroplane in 27 Days 21 Hours.

IT is not many years ago that in motor cycle trials it was necessary for officials to be posted every mile, because it was doubtful whether an internal combustion engine could be relied upon to function for a definite period, but now, the same type of engine, improved and developed by one generation of engineers, drives a giant aeroplane from London to Freemantle, a journey of 11,294 miles. Truly, the triumph of the petrol engine is made manifest, and those who have had doubts regarding the overhead valve engine should at last be convinced that it can be made as reliable as the side-by-side type, for the Rolls-Royce engines fitted in the Vickers-Vimy aeroplane which accomplished the journey had overhead valves. Each engine has twelve cylinders, therefore there were no fewer than forty-eight overhead-operated valves to go wrong—yet the Rolls Eagle is considered perhaps the most reliable aero engine in the world. The paramount value of quality is obvious in such a flight, and in this connection it is noteworthy that the Rolls-Royce car, so often quoted as a synonym of perfection in road vehicles, has built up its great reputation solely on quality of design, material, and workmanship. By that quality the Atlantic flight, and now the Australian flight, have been made possible, and in eulogising the engines we are apt to overlook the man to whose genius the outstanding quality of their performance is mainly due. Mr. F. H. Royce was born in 1863, and is the son of a Rutlandshire farmer. He served his apprenticeship at the G.N.R. Locomotive Works at Peterborough. In 1903 he turned his attention to the motor car industry at the instigation of the late Hon. C. S. Rolls, the outcome of which was the first Rolls-Royce car, a 10 h.p. vehicle, which has gradually been developed into the 40-50 h.p. six-cylinder Rolls as we now know it.

During the war the firm's attention naturally turned to aero engines, and the original 250 h.p. Rolls developed into the 360 h.p. Eagle, Mark VIII., which occupies a similar position amongst aero engines to that of the Rolls car in the automobile world.

F. H. Royce, who was responsible for the Rolls-Royce 360 h.p. Eagle engine.

eroplane, engined by two Rolls-Royce twelve-cylinder Eagle engines is the identical machine that accomplished the journey from

Capt. Ross Smith, M.C., D.F.C., A.F.C. (pilot), Lt. K. M. Smith, R.A.F. (observer), Sgt. W. H Shiers, A.F.M (mechanic), who, with Sgt. Bennett A.F.M., formed the crew

The Vickers-Vimy aeroplane is also the production of a firm of world-wide repute, and though it was originally designed as a long-distance bomber, it remained for peace to demonstrate its true utility as a weight carrier of proved reliability.

Having made the great flight mechanically possible, there remained the human element to bring it about. The pilot and observer were two South Australian brothers, who were born and educated in Adelaide—Capt. Ross Smith and Lt. Keith Smith—while the mechanics were Sgts. Shiers and Bennett. These mechanics have served under the Smith brothers during the greater part of their flying career, and after the signing of the Armistice volunteered together and served in the Afghan campaign.

That this great flight was not without incident is shown in the following cablegrams sent by Capt. Ross Smith during the journey:

"ROME.—Start sensational. Bennet held tail down until machine was moving, then made running jump at rear cockpit. Hauled aboard by Shiers as machine was leaving ground.

"AKYAB.—Left Calcutta at 8.30; landed at Akyab at 1. Large distinguished gathering to see us off, including Lady Ronaldshay. Racecourse at Calcutta is small, but when taking off many hawks circled round close to the ground. Very frightened hawk would hit propeller, smashing it.

"Just off the ground the machine struck two hawks, one hitting the propeller. Nasty moment as machine almost hit trees in avoiding more birds. No damage to propeller, but pieces of hawk hanging on machine whole journey."

The record of the flight is given below.

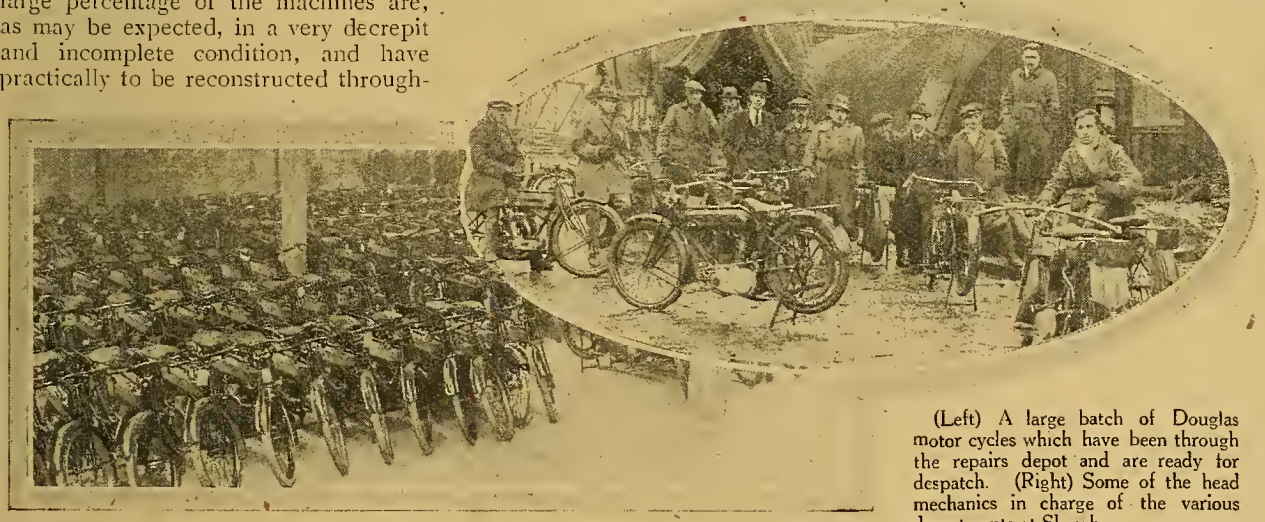
Repair of Government Motor Cycles.

How the Work of Recovery and Reconstruction goes on at Slough.

Sidecar chassis and bodies awaiting entrance to the Repair Department

ON Monday, December 8th last, we formed one of a party of technical journalists who, by permission of Lord Inverforth and the Ministry of Munitions, paid a visit to the Government Motor Vehicle Repair Depot at Slough. In addition to the very large number of motor lorries and tractors which were there undergoing repair, we noticed that practically the whole of one shop was devoted to overhauling and reconstructing motor cycles of the various makes employed during the war. Upon arrival at Slough, a large percentage of the machines are, as may be expected, in a very decrepit and incomplete condition, and have practically to be reconstructed throughout. This work keeps a large staff of mechanics continually employed, and at the present time we were told that about fifty cycles leave the shop as "runners" every day. Apparently, no attempt is made to put them in first-class running order, but, after assembling, each machine is subjected to a short road test, and should be fit for hard work on the road after a little tuning up. After all mechanical defects have been attended to, the machines are painted, though a high standard of finish in this connection is not considered necessary.



(Left) A large batch of Douglas motor cycles which have been through the repairs depot and are ready for despatch. (Right) Some of the head mechanics in charge of the various departments at Slough.

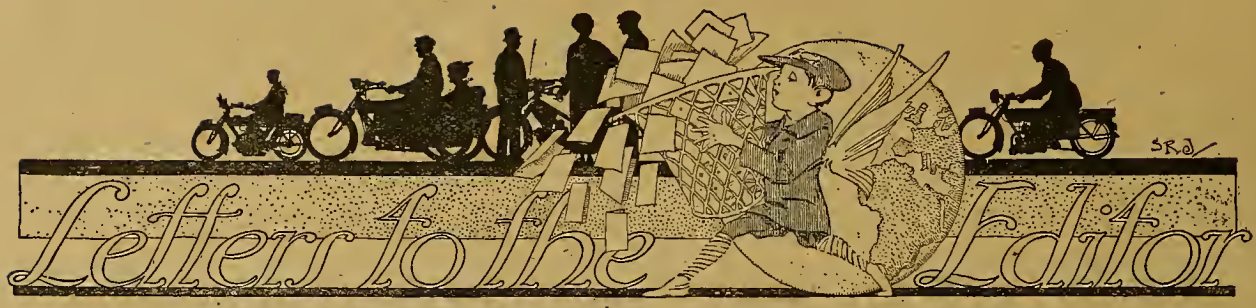
THE ANGLO-DUTCH TRIALS.

THOSE of our readers who are keenly interested in competition matters, and especially those who supported the event in pre-war days, will be glad to learn that there is every propect of a resumption of the reliability trials between teams of Dutch and English motor cyclists.

Correspondence has already passed between the secretaries of the A.C.U. and the K.N.M.V., the organising bodies in the respective countries, and the English Competitions Committee will favourably consider the event for 1920; it will be run in Holland, since the last one held took place in England.

Great enthusiasm has been displayed in Holland at the prospect of this renewal of the sporting and amicable relations which were engendered by the holding of these international reliability trials in the past, and we have full assurance that the motor cyclists of Holland will do their utmost to ensure the comfort of the English competitors who go over.

It is hoped that the date will be fixed in the near future, since the English competition programme is being rapidly filled for the 1920 season, and it would be regrettable if our best riders should be unavailable owing to their engagements in other events.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

THE VALUE OF THE AUTOMOBILE ASSOCIATIONS.

Sir,—I should like to testify to the value of the Engineering Department of the A.A. Recently I asked for their assistance concerning the purchase of a second-hand motor cycle. They spared no efforts on my behalf, with the result that I obtained a refund of £30. Surely a good return for one year's subscription! E. E. KIRBY.

A.C.U. SIX DAYS TRIALS.

Sir,—On reading the letter of Mr. Stanley Wells, in your issue of December 4th, we noticed a slight error in the table of averages, which we are taking the liberty of pointing out.

In Class "D" Mr. Wells states that five Scotts entered, scoring an average of 146 marks. On looking through the final schedule of results of the six days, as published in *The Motor Cycle* of November 6th, we find that the average figure for the five machines entered was 181.8.

Doubtless this error was created owing to the original report that Mr. Jesse Baker had retired, whereas in the final report he was granted a silver medal. This naturally makes the last column of Mr. Wells's table quite wrong. Furthermore, the Scott average is higher than any other make of machine entering more than one machine in any class. THE SCOTT MOTOR CYCLE CO., LTD.

MOTOR CYCLING IN INDIA.

Sir,—"Two-stroke" would probably find that a 5½ h.p. machine would answer his requirements better than a lightweight. It should preferably be of a well-known make, so that spares might be the more readily available. He should certainly purchase in this country, as prices in India at present are very much in excess of what they are even here. 1915 Triumphs often fetch well over £100.

He would do well to take the following tip to heart: Never send your machine for repairs to a firm where it will not be under European supervision. H.J.

Punjabis, L.I.

Sir,—"Two-stroke" writes in your issue of December 4th to ask about the capabilities of a two-stroke for India.

Let me assure him that this class of machine is excellent for India, and that if his has proved satisfactory here it probably will there. In the planting districts I know the roads are bad, and there are often weeks of continuous rain.

I ran a new two-stroke on the medium quality roads of the Poona district for over a year, and found it invaluable, and nothing ever went wrong with it.

In India new motor bicycles are now difficult to get, and the "second"-hand ones are only so labelled by courtesy. They have usually descended through many short generations of unmechanical subalterns.

Tyres are obtainable, but a reasonable selection of other spares is desirable.

Almost anywhere, "Two-stroke" may be interested to hear, a motor bicycle which will go is a readily realisable asset. RIKI.

Corstorphine.

Sir,—With reference to "Two-stroke's" letter in *The Motor Cycle* on motor cycling in India.

I spent some years in India during the war, and was continually using a motor cycle. My experiences were with Douglas, Triumph, Ariel, Harley-Davidson, and Indian. Any of the above machines will stand up to the rough Indian roads. Personally, I found a Powerplus Indian the best, notably for springing, clearance, cooling, and electric lighting.

I should not advise "Two-stroke" to take out his present machine, unless he is going to live in towns like Bombay, Calcutta, or Poona.

For up-country stations, good springing, large size tyres, good clearance, and electric lighting are most essential. Also plenty of power: a fast machine is more than a delight out there, as there are no speed limits.

Spares for American machines are more easily obtainable in India than for British.

I should strongly advise "Two-stroke" to purchase a machine here and take it out (after using it) as personal luggage. I found Dunlops best for hot roads.

Coventry. ACHCHHI-BAT.

COMBINED CYLINDER AND CRANK CASE.

Sir,—In "Ixion's" Occasional Comments, in your issue of December 11th, he refers to a certain make of motor cycle engine in which the cylinder is cast in one with the top half of the crank case, and states his opinion that this is the first motor cycle engine constructed on these lines.

Will you allow us to say that this method of construction was introduced on the Allon 2¾ h.p. two-stroke engine in 1914, and has been in practice ever since?

ALLDAYS AND ONIONS, LTD.

Matchless Works (Cycle Department).

THE BLACK PRINCE ENGINE

Sir,—In your issue of December 4th you describe the Black Prince engine as a new type. Now in 1908 the Jowett Motor Co., of Bradford, Yorks., designed and built a horizontally-opposed two-stroke engine having one combustion chamber connecting the two cylinders, and, of course, one sparking plug.

The balance was excellent, and naturally the engine could run at a high rate of speed almost free from vibration.

The design was clever, and much in advance of the times, though now, I understand, the firm market a light car fitted with an up-to-date flat twin engine.

Coventry. E.A.

THE LIGHTING REGULATIONS.

Sir,—Before the new Lighting Regulations are issued, may I appeal to you to use all your influence to have regularised the fitting of a tail light and number on the off side of the sidecar body itself. With gas there is much less draught, and with electric lighting bulbs last four times longer, and in both cases the plate and lamps can easily be kept clean. Even our Chief Constable admits this, though he thinks they are at present illegal.

Newton Ferrers. T 6409.

Sir,—I, as both a cyclist and a motor cyclist, have read with interest the letters appearing in *The Motor Cycle* on the question of rear lights.

Your correspondent "Sivel" is surely in error in some of his views. He says (I hope I quote correctly), "What, in the name of sense, do we carry a head light for? Surely to show us what is in front, etc." Now, a ship carries lights, not to light her on her way, or to show what is in front, but in order that other ships may be made aware of her presence, and of the direction in which she is moving. A vehicle is ordered by law to carry lights—one or two white lights in front and a red light in the rear. Why? In order that other

vehicles may know of its presence and direction of travel. The law is not concerned with the question as to whether the lights are strong enough to illumine objects in front. The question of the strength of the lights rests with the driver of the vehicle. Arguing on this line it is clear that a vehicle of any kind that carries head lights only is only half illuminated, as it makes other vehicles aware of its presence from one direction only.

The question of lights on pedestrians, dogs, stray brickbats, etc., is beside the argument, for pedestrians and dogs are expected, in view of their own safety, to travel principally on the side walk or the side of the road, while brickbats are accidents pure and simple. H. W. BEAUMONT.

Sir,—Your correspondent, "Sivel," seems to be under the impression that the lighting regulations are a plot designed to throw the onus of avoiding accidents on the unfortunate cyclist. A more natural view is that the object of the regulations is simply to prevent accidents from occurring.

Again, in the unfortunate event of a cyclist, with a properly burning tail lamp, being run into from behind, surely all the blame would attach to the other party.

"Sivel," however, denies that rear lamps prevent accidents. It is evident that no lamps can absolutely prevent all accidents; but they afford a decent chance of avoiding them. Even if such lights cause only one accident to be avoided in twenty possible cases, their use is justified.

Of course, if "Sivel" denies that a cyclist with a rear lamp is more easily seen than one without, on a pitch-black night, there is no more to be said.

Efficient head lamps are good Tail lamps on all vehicles make assurance doubly sure.

Personally, I would rather do my best to avoid being run into in the first place than be bowled over in the mud, and then console myself with the thought that I was not to blame, and that the onus was upon the other fellow.

Twyford. PUSH-CYCLIST.

Sir,—My letter appears to have had the excellent effect of making "Sivel" lose his temper. He now comes out with the "unalterable view" (surely this is is not a "deliberate misquotation"?) that the onus of avoiding accidents should lie with the overtaking vehicle. As he is not open to conviction on this matter, I may as well state that I entirely agree with him. But why should he wish to make it more difficult for the overtaking vehicle to carry out its duty (difficult enough at any time) by removing the only part of the vehicle in front that is easily seen?

I entirely agree with "Toleration's" very sensible letter. Laziness is at the root of the matter, and if cyclists cannot be induced to "mess about with another lamp" I suppose we must all take the consequences.

"Sivel" evidently reads the papers from the point of view of seeing how many accidents have occurred. Does he ever consider how many have *not* occurred, and, therefore, do not get into the papers at all, simply because people have been sensible enough to see the value in a rear lamp?

Finally, "Sivel" is right in supposing that I cannot match his bloodthirsty tale of the West End and the unscrupulous motorist; but, then, motorists do not make a habit of doing things of that kind; and "road-hogging" in the heart of the West End is a vice that is new to me. IORWARTH.

Cambridge.

Sir,—As a regular reader of your interesting paper, I have been following your readers' views on the above subject. Often views are one-sided and inclined to be selfish, and in some cases it is evident that your readers ride chiefly in well-lighted London district roads, whilst with riders in this part of the country it is quite a different proposition.

We in this district are very glad all vehicles have to use rear lights, and this is the only safe way of travelling, especially in the winter.

A number of my friends agree with me that very strong head lights (which one of your correspondents advocate) are a distinct danger to the public in general. Moderate strength lamps and rear red light are the safest for everybody concerned, whether a motorist or not.

Even solo riders, with rear lights, feel a great security on slippery roads when hearing large cars overtaking them. I hope the present regulations will be permanent for the general welfare of the road-using community. W.H.T.

Plymouth.

THE A.C.U. REPORT.

Sir,—I was interested to see in your issue of December 4th a letter from Mr. Jas. L. Norton on the judges' report in the A.C.U. Trials.

There has, I believe, been a rather ominous silence on this report as far as the motor cycle world is concerned; in other words, the report was such a crushing criticism of the present-day motor cycle that probably few people have cared to refer to it.

I see Mr. Norton was "disappointed to read" the section of the report which dealt with engines.

One can quite imagine many motor cycle designers being considerably more than "disappointed; they have had what might be termed "a nasty jar."

I do not wish to single Mr. Norton out in particular for criticism, but I should like to remind him and others that the A.C.U. judges also dealt with other points—for instance, lubrication and transmission.

Now for a very long time some of the leading firms in the motor cycle industry have been exploiting to their utmost a type of machine which, to any true lover of a motor vehicle, cannot approach the ideal. That is the single-cylinder, belt-driven motor cycle with no adequate form of lubrication and often a single speed. We all know that simplicity is a great asset and conducive to cheapness, but when it sacrifices efficiency and comfort and general utility there is not much to be said for it.

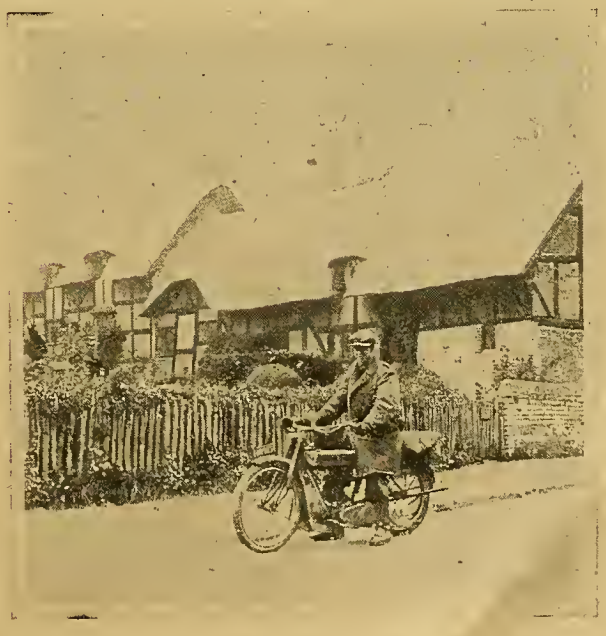
Now I imagine that the great test of utility is that a machine shall be able to do a long and possibly non-stop run over any road and under any conditions of abnormal heat or cold—or wet—and turn up at the end ready to do the same thing over again at once.

Most people will admit that almost any car is capable of this provided it is not grossly out of tune; but I think very few motor cycles are, and I believe the main reason is that the car water-cooled engine is properly cooled and the air-cooled cycle engine is not.

The air-cooled engine is all right so long as it is in perfect tune and in expect hands, but not under other conditions.

I see Mr. Norton says water-cooling is a concession to imperfect design. I should be inclined to reply that air-cooling was an obsession of imperfect design; and is Mr. Norton intending in this remark to refer to a Scott, or a Lanchester, or a Rolls-Royce—all water-cooled by the way?

I believe that the words of the A.C.U. judges were, on this point, something to the effect that "many of the machines arrived in a deplorable state of overheating, knock-



Probably the most famous historical cottage in the country—Anne Hathaway's home at Shotley, near Stratford-on-Avon, Warwickshire.

ing, and oiliness." This exactly describes the state of the average motor cycle at the end of a long and trying run, whilst any old and indifferent 10 to 15 h.p. car would arrive at the end of the same run probably quite reasonably cool and clean.

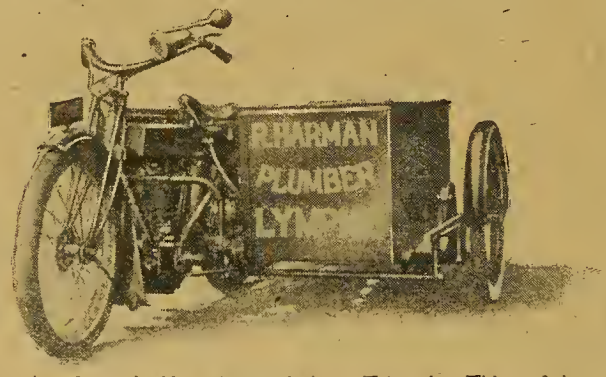
Old fallacies die hard. That is quite clear from this year's Show, but let Mr. Norton and others remember that this year the Triumph Co. have produced a chain-driven model and the B.S.A. Co. a twin—two rather notable events. Some day perhaps we shall see water-cooling, shaft-drive, automatic lubrication, and automatic carburetters just as effectively standardised for cycles as cars.

Motor cycle designers would do well to remember also that many motor cyclists have driven cars; but one is sometimes driven to think that motor cycle designers never have.

Barnes, S.W. LIGHTWEIGHT.

THE VALUE OF SIDECARRIERS.

Sir,—I am sending you a photograph of a Triumph motor cycle and trade carrier, which possibly may interest trade users, also a few details as to the adaptability of the box. The chassis is an underslung Duco, with extra strong four-point attachment, the box being framed in ash, 2×1¼in., and covered with three-ply wood. The lids are halved on top, opening from outside; this enables ladders, planks, etc., to be carried on top, the lids being folded to the front and securely tied, whilst space in the back is available for paints, etc. I can take easily the whole plant of material for painting the outside of a house, and ladders up to thirty-five rungs. The box is mounted on the chassis by screwing into the two crossbars from C



A tradesman's sidecarrier attached to a Triumph. This outfit has given the owner, Mr. R. Harman, great satisfaction.

springs four 3×⅜in. bolts, which are tapped and screwed into the bars firmly. The box is dropped on to the four bolts and secured by a washer and thumbscrew inside. When carrying heavy goods, such as cement, sand, etc., too heavy to lift out of the box, I leave the two front thumbscrews off, and I then lift up the box towards the back, which is arranged to come exactly on the ground, and heavy articles can then be pulled out. Also, any adjustment to the engine, etc., can easily be made by tilting the box, usually difficult when the sidecar is a fixture. For pleasure riding I have arranged a coachbuilt sidecar to drop on in the same manner, and I can change either box or sidecar in less than five minutes. The machine has done thousands of miles in a country district, saving much time and labour. A regular reader of your paper for years, I have gained much from its useful columns.

R. HARMAN.

RIDING AT NIGHT.

Sir,—A recent article in *The Motor Cycle* noticed and illustrated a Magdyno set by a well-known maker. Thinking the set to be generally good, but having certain serious shortcomings, I wrote the manufacturers, setting out my ideas substantially as in this letter to you. They replied they were very "interested," but "at present we do not consider the demand for a set of the type suggested would be sufficient to warrant its manufacture." After a perusal of the following, perhaps other night riders will give their opinion on the manufacturers' verdict.

The average motor cyclist, apparently, being afraid of troubles on the road after dark, appears to arrange to arrive home by dusk; only carrying lamps so as to get home if held up for a few minutes after lighting-up time. For such the Magdyno set in question is no doubt O.K. There are, however, a minority of riders who, like myself, expect to ride almost anywhere at any hour of the day or night. I leave points over one hundred miles from home either very late in the evening or very early in the morning to drive through exactly as if it were day time. Such runs need powerful lamps if speed is to be safely maintained, and I find a head lamp plus small sidecar lamp to be insufficient on an outfit. (I do very little solo riding.) A second head lamp (as Lucas "King's Own" No. 454), used as a sidecar lamp, enables one to drive, using the near side kerb or hedge bottom as a guide, causes a flash off the bright pedal cranks of push bicycle riders, enabling one to pick them out when they attempt suicide by riding without a rear light, and greatly helps the head light (say, a Lucas "King of the Road" No. 462) to show up cattle, country carts approaching unlighted on the wrong side, etc.

My experience, therefore, causes me to believe that the makers of the Magdyno set should market an alternative set, the sidecar lamp being the same size and power as the head lamp, and embodying the following features:

This lamp should not be carried over the sidecar mudguard, but well forward, on a bracket screwed to the near side of the sidecar body, say, well in front of the door, as nearly as possible in line with the head lamp. It should have a fitting quickly detachable from this bracket, little legs so that it would stand on the ground, and a separate three yards or so of easily detachable flex, so that it could be removed from the bracket and moved around to get a good light for repairs. The sidecar lamp should be the removable one, as the head lamp and rear lamp should always be left in place, as if the machine is drawn up close to the near side of the road with these lamps burning, the machine facing the direction one should be travelling, there is little chance of being run down.

A most essential additional fitting is a torch, carried in a clip (say, on the handle-bar), from which it could be instantly lifted, to switch on and off as desired, powerful enough to throw a beam the width of the road, thus enabling one to read signposts from the saddle when standing with the clutch out and engine running. This torch could have 3ft. or 4ft. of flex, self-rewinding into a small box, like a "Chesterman" steel tape, and thus arranged would be invaluable for the purpose cited; also as an inspection lamp and on repairs in conjunction with the powerful movable sidecar lamp already referred to. If clipped near the right handle-bar grip, glass facing forward, one could switch it on for a few moments to show an approaching car the exact width of the combination when approaching each other on a dark narrow country road.

As both the head and sidecar lamps should be fitted with both dim and full light bulbs (lamps), there would be no need to use more than sufficient light on any occasion, or dazzle the sight of those approaching. One switch to control the dim and full light on both these lamps simultaneously would be preferable.

I know from the powerful set of carbide lamps I use, movable by connecting up with a long spare piece of rubber tube, that, much as I desire electric lighting, the convenience of the carbide set, to one who really rides at night on deserted and unlighted country roads, must at present appeal more strongly to me. Properly fitted and kept clean I find Lucas carbide lamps seldom give trouble, not even the rear lamp run off the head lamp generator *via* large bore metal tube. (Carry a spare burner for each lamp, and throw away the used one occasionally.)

I am afraid I have made an uncomplimentary remark regarding push cyclists. Perhaps they will take it in good part when I mention I purchased my first bicycle—a broken-down solid-tyred affair—for about six shillings before the Boer War, and have ridden many push and motor bicycles since.

Why does not Lucas make push cyclists a rear lamp similar to the No. 344?

Why do not Bowdens make a tube, similar to their outer cable, that is carbide gastight, to take the place of rubber and metal tube for connecting up. Ordinary Bowden outer cable will only retain carbide gas for a few weeks, then it gets slightly porous all over, and one gets a bad light. Otherwise, it would be a neat, flexible connection that could not get nipped.

J.M.

Sheffield.

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Reboring Cylinder.

(1.) I have a 3½ h.p. water-cooled engine and the cylinder has become scored; how much should I bore it out? (2.) What working clearance should there be between cylinder and the new piston? (3.) Are step-cut piston rings better than those with plain sloping cuts?—C.J.H.

(1.) We should not advise you to grind the cylinder bore more than 8/1000. (2.) The piston clearance should be approximately 2/1000 at the skirt, and five to seven thousandths at the piston top. (3.) Step-cut piston rings retain the compression more effectively than those with plain slots, but should be fairly wide.

Double-acting Two-stroke.

Will you kindly tell me if an internal combustion engine, firing at both ends of the stroke and working on the two-stroke principle, so that the piston has propelling force behind it on each stroke, has ever been invented and patented? In your opinion how would such an engine compare in respect of efficiency, economy, vibration, "revving," with the ordinary four or two-stroke engine?—O.B.M.

Several double acting two-stroke engines have been designed, but we cannot recollect one being manufactured commercially. It does not appear that such an engine will have very great advantages over existing types, largely owing to the weight of the reciprocating parts and piston cooling difficulties.

Oil Pump Trouble.

I am troubled by the oil pump (semi-automatic type) on a B.S.A. On pushing the plunger to the bottom of its stroke, the oil will drip at first, then gradually stop. I have put new packing in the gland (ordinary string), and left it so slack that the oil leaked a little; but it was of no use. I then got a new spring from the makers with no better result. Is the packing wrong? It seemed to be string which was used in the first case.—L.C.D.

Possibly the trouble with the semi-automatic oil pump on your B.S.A. is due to the non-return ball-valve being choked with dirt. It is situated immediately to the right of the oil-pump plunger on the connection between the pump barrel and the sight feed lubricator, and is covered by a small set screw. It is usual in packing the pump plunger gland to use asbestos string.

Belt Trouble.

My machine, a 3½ h.p. Rudge Multi, has run 3,750 miles, about half of which has been done with my wife as pillion passenger. The motor cycle has given every satisfaction, but I want your help in choosing a suitable belt, as I have used four already in the above distance. One of these was a 1in. belt, which I found was not flexible, and would not bend round the pulley on low gear. Consequently, I have konked out on hills through not being able to get down to the bottom of the pulley. This belt has lost some of the rubber from its sides after a few miles only. There is another item which has caused me a little trouble. The heads of the right-hand spokes on the back wheel keep breaking occasionally, always in the same place.—W.H.

Excessive belt wear in connection with the Rudge Multi transmission is usually the result of incorrect methods of driving. You certainly appear to have been unfortunate, and we suggest that you take special care when manipulating the gear to effect the changes gradually, working the gear lever notch by notch. Under no circumstances should you move it suddenly from one extreme to the other. You will understand that a 1in. belt used on the multi gear does not permit so low a ratio as a ⅞in. belt. The spoke breakages in the rear wheel may also be the result of violent gear changing and harsh use of the clutch.

Fitting a Gear.

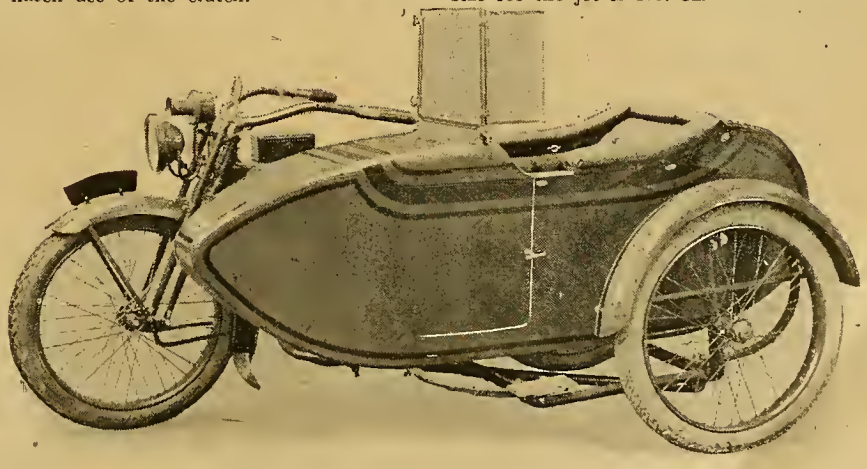
Can a three-speed Sturmey-Archer countershaft gear be fitted to a single-speed standard 3½ h.p. 1914 Rudge?—W.E.H.

A Sturmey-Archer three-speed countershaft gear might be fitted to the single-speed 1914 Rudge motor cycle, provided you could obtain a special bottom bracket to carry the gear. The fitting of this would necessitate rebuilding of the rear part of the frame. Consult the makers.

Overheating.

I have a 1911 3½ h.p. motor cycle which gives a lot of trouble through overheating; could you give me some advice how to keep it cool? Also could you let me know the exact valve timing for this engine, and the best size jet for solo work? The engine has just been overhauled.—N.E.S.

Since your engine has just been overhauled, the overheating is most likely the result of late ignition timing. The best setting for the ignition is as follows: Retard the magneto control two-thirds, rotate the engine until piston is at the top of the compression stroke, and then connect the magneto drive when the contact breaker points are just separating. Valve timing as follows: The exhaust valve should close as the piston reaches the top of the exhaust stroke, and the inlet valve at this point should be just commencing to open. The most suitable size for the jet is No. 32.



Glancing at this sidecar one would not suspect that it is equipped with a hood, yet by opening lockers for which the arm rests form the lids, a hood can be raised instantly. The sidecar was one of the attractions on the Harley-Davidson stand at the recent Olympia Show

Life of Machine.

I have recently purchased a good, sound 1915 Douglas, which I use for taking me into business every day. The distance is eleven miles, making a total run of twenty-two per day. The machine is in sound condition, and the roads are splendid. Now, do you consider this daily run, for an indefinite time, too hard on the machine?—V.B.

A daily run of twenty-two miles will not overtax your machine, provided it has a certain amount of attention. Given reasonably good fortune, you should easily achieve a mileage of 5,000 without serious repairs or renewals being necessitated. The machine should then be thoroughly examined, after which it should be good for the same, or even a greater, distance.

A Complicated Accident.

I should be much obliged for your opinion on the following matter. Recently I was driving my 8 h.p. and sidecar outfit from Barnet towards London, and just before reaching Whetstone a pedal cyclist, who was evidently riding outside the range of my two head lights on the left of the road, and whom neither I nor my wife saw, suddenly shot in front about 10ft. away. I applied my brakes and brought my machine to a standstill, but not before colliding with the cyclist in the rear. The impact was sufficient to turn my handle-bars in the head, and just to send my machine on to the tramlines on the other side. A Ford car, coming in the opposite direction, ran into me, and caused considerable damage to my outfit. I was driving on the tramlines on the left of the road; the Ford on the lines on its side of the road. My wife was injured on the head and arm, and while I was attending to her the cyclist disappeared, so I did not get his address. The Ford owner has now sent on a claim for £30 damage to his car, which I shall dispute. When the car hit me I was stationary. My speed when I hit the cyclist was 18 m.p.h. I estimate the speed of the car at approximately 25 to 30 m.p.h. The Ford owner told me he was fully insured. Unfortunately, I am not. The Ford's front axle was pushed back about 6in., and other minor damages. My sidecar body was smashed, chassis bent, and front forks badly buckled. Will you please inform me if, under the circumstances; the car owner can hold me liable? This accident would not have happened if the cyclist had carried a rear light.—A.G.C.

The evidence which you place before us is somewhat confused, and, in certain senses, contradictory. The accident appears to have been one of those occurrences in which neither of the parties involved could legally be blamed. We think your best course will be to submit the whole matter for the arbitration of the Automobile Association, since you are both members. Although, of course, the lack of the rear light on the pedal cycle was the initial cause of the accident, the law at the time did not compel the carrying of a rear light on cycles, and, consequently, you could not proceed against the cyclist on that account.

Sprocket Sizes.

My present top gear on a 3½ h.p. motor cycle and sidecar (fitted with Bowden gear) is 5 to 1. I am anxious to lower the top gear to about 6 to 1, and should esteem your assistance. At present the sprocket on the engine-shaft is 13T., countershaft sprocket 28T., with 8in. pulley and 19in. belt rim. I propose changing the countershaft sprocket from 28T. to 30T. Would this have the desired effect?—J.P.

With the sprockets and pulleys at present fitted to your machine the gear is 5.1 to 1. A thirty-tooth sprocket on a countershaft would give you 5.5 to 1. The best way of reducing the gear to 6 to 1 would be to retain the present countershaft sprocket, and fit one with eleven teeth on the engine-shaft, if this is possible.

READERS' REPLIES.

Oil Slinging from Gear Box.

Referring to "G.N.'s" query on page 617 of your issue of November 20th, I experienced the same trouble of oil slinging on my 3½ h.p. Rover about six months ago, causing excessive belt slip, and covering everything in oil. After endless trouble, I got over the difficulty by taking down the gear box and fitting a stout felt washer, and using thicker grease in the box, being careful to fill it only just up to the shaft. At first I thought the oil came from the engine through the chain case to the belt pulley, but in the end I found all the trouble was from the gear box.—H. VINCENT-FEDDEN.

On page 688 of the issue of November 27th there is a reply to a question regarding an Ariel gear box. Apparently this requires a new felt washer, and, if the owner will have this sent along to us, we shall be pleased to do what is necessary. The grease we recommend for our gear box is Price's Belmoline "B," and we use this ourselves. Ordinary engine oil is not satisfactory.—ARIEL WORKS, LTD.

RECOMMENDED ROUTES.

FROME TO HOLYHEAD.—P.L.

Frome, Bath, Swainswick, Stroud, Gloucester, Tewkesbury, Worcester, Kidderminster, Bridgnorth, Shrewsbury, Oswestry, Llangollen, Corwen, Bettws-y-Coed, Bangor, Holyhead. Approximately 210 miles.

HIGHGATE TO MARPLE.—F.G.

Highgate, Finchley, Barnet, St. Albans, Dunstable, Fenny Stratford, Stony Stratford, Towcester, Weedon, Daventry, Ashby, Kilsby, join Watling Street and straight on to Atherstone, Burton, Tutbury, Sudbury, Ashbourne, Mayfield, Leek, Macclesfield, Marple.

LEICESTER TO TOOTING.—R.J.H.

Leicester, Lutterworth, Kilsby, Daventry, Weedon, Towcester, Stony Stratford, Fenny Stratford, Dunstable, St. Albans, Elstree, Edgware, straight on to Marble Arch, Park Lane, Knightsbridge, Brompton Road, Fulham Road, Battersea Bridge, Clapham Common, Balham, Tooting.

SPARKLETS

National Union of Manufacturers

We are informed that the British Rubber Tyre Manufacturers' Association has recently joined the National Union of Manufacturers.

Petrol Taps and Motor Fittings.

Messrs. S. A. Lamplugh, Ltd., King's Road, Tyseley, Birmingham, send us an exceedingly well got up catalogue of petrol taps, compression taps, and other useful fitments. In it is described lucidly and in detail the ingenious throttle-controlled automatic oil pump for motor cyclists marketed by this firm.

Arden Two-stroke Engines.

We learn that these engines, which were recently described in the pages of *The Motor Cycle*, are now being produced in fairly large quantities. The Endurance Cycle Co., Sheepcote Street, Birmingham, who are the sole distributing agents, are now rapidly booking up contracts for 1920 production.

McLean Fork Springs.

For some time we have been testing the McLean spring on a 4 h.p. Triumph. This was described in *The Motor Cycle*, October 16th, page 425. It has proved to be eminently satisfactory, as it greatly improves the appearance of the machine and renders the riding most comfortable. The McLean spring fork is in future to be handled by the Gosport Engineering Co., Gosport, Hants.

Welding Repairs in Ireland.

Messrs. Barimar, Ltd., inform us that they have now opened a branch depot at 185, Great Brunswick Street, Dublin, Ireland, where they will undertake all welding repairs, and thus save unnecessary delay in sending these to the head office in London.

This firm also intends to open branches in France, Australia, New Zealand, Delhi, Calcutta, Bombay, Madras, Karachi, Burma, Ceylon, South and East Africa, Denmark, Norway, and Sweden.

Dissolved Acetylene.

Numerous queries have reached us in the past concerning the lighting of motor cycles by dissolved acetylene. The requirements of our readers are now being carefully studied by Messrs. Allen-Liversidge, Ltd., 106, Victoria Street, London, S.W.1, and this firm will shortly place on the market a cylinder for motor cycles. The dimensions of this will be 10in. × 3in., and the weight will not be excessive on either solo machines or sidecar outfits. The cylinder is of steel, and is fitted with a gauge at its base showing how much gas there is inside. The cylinders will be sold at £3, and refills will be obtainable for 3s. Roughly speaking, one of these cylinders will light a head lamp for the space of twenty-four hours.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 2/-, and 2d. for every additional word. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable & Co. to ILIFFE & SONS Ltd., and crossed Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.4), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box ooo, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. ooo, c/o "Motor Cycle," 20, Tudor Street, E.C.4. *Replies to Box Number advertisements containing remittances should be sent by registered post, but in all such cases it is advisable to make use of the Deposit System.*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, ½ %. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited. The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

IMPORTANT NOTICE.

Owing to the Christmas Holidays, the issue of "The Motor Cycle" for January 1st will be closed earlier than usual. All copy and instructions for Miscellaneous Advertisements must therefore be in our hands not later than first post on Tuesday, December 23rd.

CROW Bros., High St., Guildford, A.J.S agents since 1912. Deliveries have begun 4083

A.J.S. 2¾h.p. 3-speed T.T. model, all on, very fast; £55.—2b, St. Mary St., Woolwich. [X1069

1914 A.J.S. Combination, in perfect running order, all tyres new; £98.—26, Castlebar Mews, Ealing. [5602

A.J.S. Brand New 6h.p. Combination, screen, spare wheel, tyre.—Parker's, Bradshawgate, Bolton. [X1115

A.J.S. 1914-15 Combination, as new, spares and accessories; £110.—S., 6, Neville Court, St. John's Wood. [5394

A.J.S. Spares; engine and gear box repairs; prompt delivery.—Cyril Williams, Chapel Ash Depot, Wolverhampton T.A.: Parts. [2237

A.J.S. 6h.p. Combination, 3-speed, clutch, kick start; £97, or exchange for lightweight and cash.—35, Rosemary Rd., Clacton-on-Sea. [5376

WAUCHOPE'S, 9, Shoe Lane, London; 1915 A.J.S. 4-5h.p machine, 3-speed and clutch and kick starter, with coachbuilt sidecar; £130. [5991

2¾h.p. A.J.S., 3-speed, kick starter, splendid condition; £60; seen in Derby by appointment.—Sayer, Hill Bank, Quarndon, near Derby. [5383

A.J.S. Combination, just delivered, brand new, spare wheel, spring seat-pillar, wind screen, tools; £200 cash, or offer.—Box 955, c/o *The Motor Cycle.* [X1019

A.J.S.—Exeter Motor Cycle and Light Car Co., Ltd., Bath Rd., Exeter, and 28, Tavistock Rd., Plymouth Sole agents. Now booking for earliest deliveries. [0061

1915 6h.p. A.J.S. Combination, 3-speed, countershaft, kick start, screen, 3 lamps, new Watford speedometer, sound condition; £110.—18, Cecil Av., Wembley. [X1091

1916 6h.p. A.J.S. and Sidecar, 3-speed, countershaft, hand-controlled clutch, complete with lamps and horn; £110; in very good running order.—Box L6,201, c/o *The Motor Cycle.* [6003

A.J.S. 1915 6h.p. Combination, complete lamps, horn, spare wheel and tyre, hood, screen, luggage grid, etc., excellent condition; £125.—Rev. Copleston, Widworthy Rectory, Honiton, Devon. [5869

1919½ A.J.S. Combination, 3 Lucas lamps, hood, screen, horn, speedometer, spare wheel, spring seat-pillar, tools, excellent condition; owner buying car; £180.—Naylor, Lea Haven, Oldnall Rd., Kidderminster. [X0921

1919 A.J.S., delivered Nov. 16th, wind screen, spare wheel, apron, 4 brass lamps, big head lamp cost £14, 2 sidecar lamps, fitted like a car, electric lighting, 2 accumulators; best over £200.—Gee, 65, Ablewell St., Walsall. [X0675

A.J.S., 1919, military model, 6h.p., ridden 70 miles, condition new, Lucas horns, lighting set, tools, —3-speed, Tan-Sad; first offer over £130 secures; private.—Apply, Harry Perry, 98, Grange Park Rd., Leyton, E.10. [5695

MOTOR CYCLES FOR SALE.

A.J.S.

1919 A.J.S. Combination, hood, apron, curtains, lamps, Klaxon, Watford trip speedometer, special Triplex wind screen, spare wheel, plugs, tools, knee-grips, insurance £250. This excellent turnout to be sold complete with 8ft.×6ft. portable garage, ⅝in. matchboarding, felt roof, bolts; £225; no offers. Seen in London by appointment.—Box L6,076, c/o *The Motor Cycle.* [5301

1919 A.J.S. Combination (mid-Sept.), spare wheel, luggage carrier, apron, screen, mat, tools, pump, mileage under 900, all tyres practically as new, Lucas King of Road head, T.W.R. side, P. and H. rear, Watford speedometer, foot Klaxon, Lucas horn, Clayrite mirror, handle-bar muffs; £195; would exchange 1920 Morgan, cash adjustment; Friday, after 6.—64, Gladsmuir Rd., Highgate, N.19. [5674

A.J.S. 1916 5-6h.p., 3-speed countershaft, interchangeable wheels, kick starter, hand clutch, spare wheel nearly new, wicker sidecar, special carriers, apron, skin mat, engine lately overhauled (£20), new enamelled tank, combination lamps, best horn, spare chains, new valves, etc., perfect order, negotiating 2-seater; best offer over £110; also light cane sidecar for 3½h.p. engine, £7.—Sedgwick, Kirkby Lonsdale, Westmorland. [5698

Alldays.

ALLONS at Gourlay's, Fallowfield, Manchester. [2832

ALLON, 1919 (July), 2-speed, clutch, spare belt, splendid condition, tyres unpunctured; £65.—26, Hurst Rd., Horsham. [5398

HOME

BOOT REPAIRING.

"Elite Rivetless Soles."

Soles STUCK ON—NO TOOLS REQUIRED.

These Soles are specially prepared with an adhesive surface and fixed with Elite Sol-fix Solution. WE GUARANTEE THEM TO HOLD AS FIRM AS RIVETS OR SEWING. The process of fixing is exactly the same as that of repairing a punctured Motor or Motor Cycle tube. One of the many great advantages of our process is that no damage whatever is done to the Boots or Shoes which, when fitted with our Soles become ABSOLUTELY WATERPROOF. Full instructions given with each pair of Soles.

of all Dealers.

Plugs we have yet produced are the Sphinx Bar-Type Mica and Bar-Type Ceramic, which possess peculiar merit in the design of the firing points. These

SPHINX

plugs give excellent results at both high and low speeds When the magncto is running slowly, and its impulse is at its weakest, this form of firing point gives the hottest possible spark. As the current voltage and volume increase, it accommodates itself automatically, always affording a minimum resistance and a maximum area to the spark.

The Steatite Model is the general purpose plug, but the Mica Insulated Type should be used where much heat or vibration are involved.

Greetings.

A LITTLE over a year has elapsed since the signing of the Armistice, and motor cycle matters are once again assuming a more normal aspect. Many of our readers have been disappointed at being unable to obtain new mounts, owing to the fact that mass production has not yet got into its stride, and that manufacturers have been held up by labour troubles and shortage of materials. At this season of the year it is opportune to remember that our motor cycle manufacturers played an enormously important part in the winning of the war, and that many of them have experienced a very difficult time in reorganising their works for motor cycle production. At the close of the year we may look back on the past with satisfaction. Never has there been such a demand for motor cycles as at present. Never has there been such promise of progress on sound and satisfactory lines, and never have we known a time when more large and important business firms have turned their attention to satisfying the needs of the motor cyclist.

It is the pleasant duty of *The Motor Cycle* to be of service to rider and manufacturer alike, and to help forward the motor cycle movement by every means in its power, and it is satisfactory to note that its campaigns for genuine improvements always bear fruit, while the ever-growing number of readers encourages us in the belief that our efforts are appreciated.

Our heartiest greetings go alike to all those interested in motor cycles. To manufacturers: May your plans for producing our future mounts be successful from every point of view. To agents: May your efforts to sell be supported by both manufacturers and public. You have an almost limitless market if you can deliver the goods. To riders: May you obtain the object of your desires without delay, and may you spend many a happy day on the chosen mount. And to all our readers, at home, overseas, and in foreign climes: A Happy Christmas.

Christmas Trials.

MOTOR cyclists who will rise from their Christmas festivities to participate in a long distance trial are regarded as mad-men by those who are less keen, but, undoubtedly, such events help to make the motor cycling movement what it is to-day. Reminiscences of the London-Exeter and the Bristol-Land's End Boxing Day Trials are the enthusiasts' chief stock-in-trade, and, while the conditions are usually hard and trying, it is their difficulty that makes the winning of a "gold," or an award of any kind, an honour worthy of the effort. It is the question of pride of achievement that attracts the entry. Every man entering takes pride in the knowledge that the total entry represents only about .1% (or one in every thousand) of motor cyclists in this country—to be that one in a thousand is, in itself, something of which to be proud. This year the Boxing Day events show every sign of regaining their pre-war popularity, which shows that the present-day motor cyclist is in every way as keen as his *confrère* of 1910-1913.

When all is said and done, we think the real attraction of such events is love of adventure, which has gone so far to make this country what it is and which contributed so much to winning the late war. It is an excellent thing to find the young manhood of our country is inspired with such a spirit, so awake and enthusiastic at a time when one may reasonably expect an attitude of apathy after the strenuous times during the war.

As tests of machines these trials pale before their severity as tests of men, yet a majority will come through smiling, with awards to their credit which they will thoroughly deserve.

And who benefits by such trials? The country as a whole; because they help to breed strong, resourceful, hardy men who are not afraid of discomfort to bring about an end, and motor cycling posterity, because they help to breed better motor cycles.

An Index to the advertisements in this issue will be found on the page facing the back cover.

Steering Design.

TRIALS of a few 1920 models have again reminded me of the marked variations which distinguish the steering of different makes of motor cycle. For example, during the past month I have driven three machines which were terrors on grease. As an amateur critic I should ascribe their misbehaviour to the following factors: A had an almost vertical rake on the front forks; B had its engine much too high up (excessive road clearance is not without due penalties); C had far too long a wheelbase. All three machines were really mildly alarming even to a practised rider. Some readers may have had occasion in the past to straddle a frame which has been distorted by a head-on biff or by several thousand miles with a badly fitted sidecar. If so they will understand the sensations to which I refer. Such trials actually suggest that a frame is laid out by fifth-rate makers on the drawing-board with sole reference to the dimensions of the items which have to be housed within it, and without consideration of the factors which render a mount stable and pleasant to handle.

On Holiday.

AS the result of bad attacks of Showitis, a colleague on the staff of a sister journal and myself are spending a brief holiday in the wilds. He is one of those opulent, indolent, corpulent, flatulent people who drive cars; whereas I—well, all veteran motor cyclists have a lean, Aussie kind of look, due to many years at the run-and-push start. In this rural fastness, grease, corners, and gradients are the rule. The other night we ran out of baccy. Nearest shop, five miles. Weather—unfit for flying. We tossed up who should go and buy. I lost. As a consolation prize he lent me his car; having taken an awful purler by daylight on a certain fierce bend, I was temporarily off motor bicycles. The baccy being successfully procured, I started for home, thanking my stars I was snug inside a coupé, instead of perched like a parrot on an unprotected motor bicycle amidst gales and hail. Suddenly, the engine coughed to rest. No petrol, I thought. Investigated. Jones, always a canny soul, had a spare tin in the boot. Transferred it to the tank. Horrors. The car had a vacuum feed. We have not vacuum feeds on motor cycles yet, but—

Bad to Worse.

AN innocent motor cyclist can hardly be expected to know how to fill up a dry carburetter from a dry vacuum feed. Brainwave No. 1. Removed lid of float chamber. Sloshed juice in from a tin. Replaced lid. Brainwave No. 2. Pushed car on a few yards lest spilt petrol should ignite. Engine still reluctant to start, and radiator rapidly freezing. Tackled ignition. No spark at front plug. No spark at any plug. No spark at distributer. Brainwave No. 3. Remove switchwire. Still no spark. Gentlemen, it was pitch dark, and no lamp on the car could conceivably be trained on the ignition details. I gave it up. Fingered my A.C.U. "get-you-home" tickets. Not much good on a lonesome road five miles from a repairer. Brainwave No. 4. There is a farm at the foot of the next hill. Pushed to top of hill. Freeled down it. Woke farmer. Yes, he has a horse. No, he won't pull my car home, because his horse is a shaft horse, and won't pull in chains. No, he hasn't a stable where I can leave the car. Brainwave No. 5. Attach trap to horse. Attach car to tail of trap. Horse will then be in shafts, and will suppose that the extra weight is merely the farmer's wife. Trap attached; car attached. Horse satisfied. And so home. Colleague greatly dissatisfied. More dissatisfied next morning when daylight proves that his mag. has gone hopelessly dud. I disport myself lavishly over the countryside on my motor cycle, while he tries to extract nutriment from yesterday's *Pickleton Gazette*. Said journal is principally interested in profiteering on the part of manure dealers. Serves him right for winning the toss overnight.

Occasional Comments.—

Speed Wobble.

SURELY Mr. Behren's Oxford don rather begged the question which was put to him. Speedman's wobble is obviously a question of dynamics. Equally obvious is the fact that equilibrium tends to disappear when a bump is encountered above certain speeds. But what we want to know is *why* equilibrium is lost on certain machines at speeds which are within our reach—*e.g.*, I have a machine which speed-wobbles at 52 m.p.h.—and *why* other machines maintain their equilibrium up to their speed limit. If this point is once cleared up, we can exorcise speedman's wobble for good and all. At present some designers know nothing at all about it, and those who know will not tell.

Export Trade.

I HAVE just read a savage letter from a New Zealand garage owner, denouncing British manufacturers for their neglect of trade in his country. He remarks that in fifteen years' experience he has seen the British come along and oust the French, then die away and relinquish their market to America. I agree with every word he has to say anent pre-war days. Everybody admits that most of our motor firms lacked constructive imagination in that era. They were content with small outputs, the bulk of which were absorbed by the home market. If an overseas buyer ordered a British motor, too often he bought it at his own risk. Local "service" was often non-existent, and the manufacturers, as a class, failed to recognise the immense possibilities of overseas business, keenly sought and efficiently handled. Now comes the tragedy of lost opportunities. The war has changed our mental attitude. Most makers have formed grandiose plans for nursing the overseas market. But at least a year must elapse before these plans can commence to bear fruit. The home demand will sop up practically the whole of the output. Financial handicaps intensify the difficulties of competing with America. The trader who has tardily awakened to the opportunities which overseas customers afford is doomed to sit helplessly watching, whilst other nations step in where he once refused to tread. For the moment, our overseas markets are temporarily at the mercy of America. But I fancy, nevertheless, that we shall not finally surrender them without putting up a sound battle. Within a year or two we shall be making far more motor cycles than can ever be sold at home; and the overseas customer will then be given some tempting bargains, coupled with superfine service.

Bad Testing.

HAVE all the D.R.'s found excellent jobs? I once mused to myself that the aftermath of the war would equip all the motor cycle factories with an embarrassing selection of skilled testers. Yet I hear to-day from a Birmingham correspondent that his new machine was delivered with the belt pulley at least half an inch out of line with the belt rim. Not being accustomed to belt drive, he discovered the fault through the rapid wear of the parts concerned. When he returned the machine, the makers behaved sensibly, and put things right. But on this occasion their fitter mounted the two plates of the new fastener on opposite sides of the ends of the new belt, so that the drive was again a good half inch out of line. There is surely no shortage of skilled riders for testing purposes? I am perfectly certain that my 1919 machines were passed for delivery by D.R. testers, for no C3 man could have started them in the tune in which they reached me.

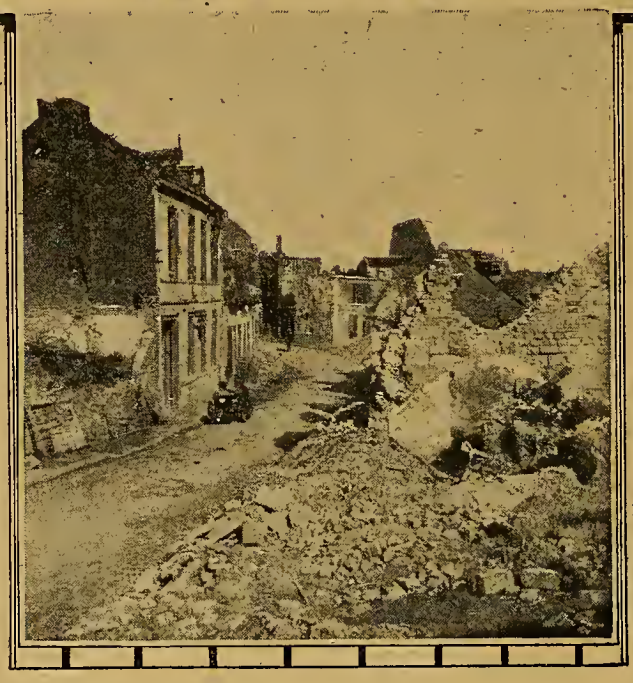
A TOUR IN THE DEVASTATED AREAS

A Post-war Trip in the North of France on a Motor Cycle and Sidecar.

By MAJOR H. G. GUINNESS.

HAVING seen three years' active service in France, it may seem strange that on demobilisation we found ourselves planning a motor cycling tour in that country; but, as photographic souvenirs are of such interest, and otherwise impossible to obtain, we decided to take a camera and tour the battlefields.

Fortunately our 4 h.p. machine and sidecar of well-known make were almost new, so, in spite of their comparative lightness, we decided to use them. However, as our luggage capacity was strictly limited, it was only possible to attempt a ten days' trip of some 600 miles.



"We were in the devastated areas and wished to visit certain places of especial interest."

Preliminary arrangements regarding triptych (for passing the Customs), driving licence, etc., were quickly and easily made by the A.A. and M.U., and lists of the best routes and hotels that we might require were prepared by that organisation.

The run from London to Folkestone was uneventful, and next morning the Association's representative met us on the wharf and attended to the embarkation of the outfit.

A Useful Tip.

As the boat arrived in Boulogne by 3 p.m., it was decided to run on to Abbeville that night. Our first experience of French *pavé* was not to be pleasant, as those who know Boulogne may well believe; but, much to our relief, macadam replaced the cobbles when we got clear of the town, and an average speed of 14 m.p.h. was then maintained in spite of inevitable stops at railway crossings. At one of these, however, we were to learn something, for, as a despatch rider drew up, we noticed his 26in. × 2⅜in. rims had on 28in. × 3in. tyres, and he assured us that, although they were an easy fit, they held on well if properly inflated, and, naturally, gave a much smoother ride.

The next day our route lay through Amiens, and the familiar lines of trees along the straight open roads were passed more quickly than they ever were in war days, when walking and lorry hopping were the only means of transport available to us. Albert was our resting place that night, and we were accommodated by an old British despatch rider and his French wife, who have set up an accommodation house amongst the ruins of that town and give tourists every attention.

Up to this point, only well known roads had been encountered, but, now that we were in the devastated areas and wished to visit certain places of especial interest, it was a question of pottering along where possible tracks existed and walking the rest. Our engine kept wonderfully cool considering the miles of continuous second and first gear work that were inevitable under these circumstances.

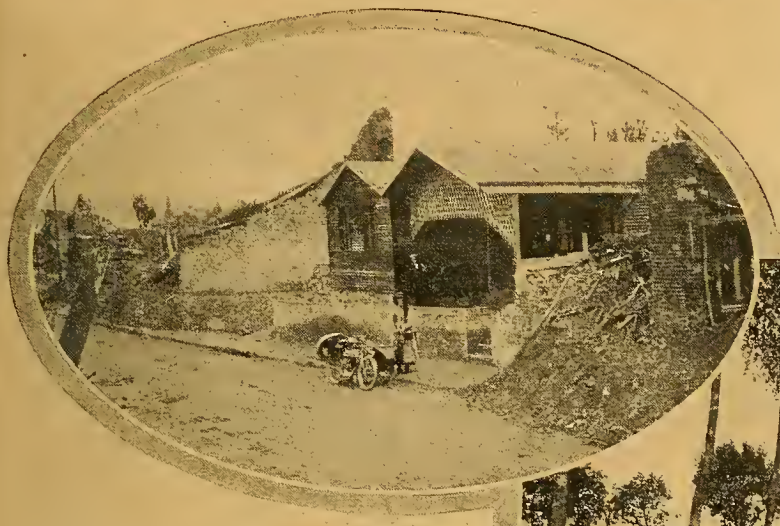
From Albert we journeyed to Arras *via* Bapaume and the many ruined villages lining the route, and, on arrival, were glad of a comfortable bed and good meal in one of the less damaged hotels. It was interesting to note how specially prepared paper took the place of glass in most of the window-frames, and how plaster work, done by a clever workman, could hide a multitude of holes—for Arras is rapidly being restored, and good accommodation can be obtained there.

The next day we passed over Vimy Ridge and on towards Lens—one of the most wrecked towns in Northern France—and had miles of badly laid *pavé* to encounter, which forced us to keep down to an average of 6 m.p.h. until Armentières was reached. This took us past such famous places as Loos, Hulluch, La Bassée, and Neuve Chapelle; but the road was so poor that, unfortunately, we could not give much attention to the country, and the passenger also was thankful for the final stretch of macadam to Poperinghe.

Normal Conditions Re-appearing.

Here things seemed almost normal, for harvesting was in full swing, and the hop-pickers were busy getting in their crops. The town offered excellent accommodation, and dinner in the garden of the old hotel brought another day to a satisfactory end.

From here trips were made over the very indifferent roads to local places of interest—Bailleul, Kemmel, and Ypres—after which the Passchendele Ridge was



(Left) "We were accommodated by an old British despatch rider and his wife, who have set up an accommodation house amongst the ruins of that town."

(Right) "It was this north and south route which was of such strategical value to the Boche."

crossed and the old Menin-Roulers road tested. It was this north and south route which was of such strategical value to the Boche in the late war, enabling the rapid movement of troops from one part of the line to another. Our progress, however, was slow, for one of the sidecar springs broke on the unspeakable *pavé*, a local repair being necessitated. But good time was made over the last stretch to Bruges as we passed the low-lying but timbered country of that part. This canalised district, with its docks and ports, was of special interest; the submarine shelters and defences being very well worth visiting, while the stretch of asphalt road running through the sand dunes to Ostend proved a delightful change, for the surface was excellent, the scenery pretty, and the German coastal defences a never-ending wonder. South of Ostend was seen the large (German) naval gun which shelled Dunkirk, some twenty-six miles away. A small Belgian boy guided us to the wood which was this Bertha's home, perching himself on the carrier and much enjoying the ride. All the roads of this part and through Furnes and Dunkirk were much better in surface than those encountered further south, and the run to Boulogne was accomplished without incident.

We had been fortunate to accomplish this tour without any tyre trouble or stoppage whatever, excepting for the broken spring, and put it down to neither having attempted the impossible in the way of roads or loads, nor having tried to average too great a daily mileage. Of course, for the solo rider, difficulties are greatly minimised, for the cinder and macadam footpaths along many of the *pavé* routes offer an excellent track; and the phantom of a mangled sidecar frame

"Bapaume and the many ruined villages lining the route."

A Tour in the Devastated Areas.—

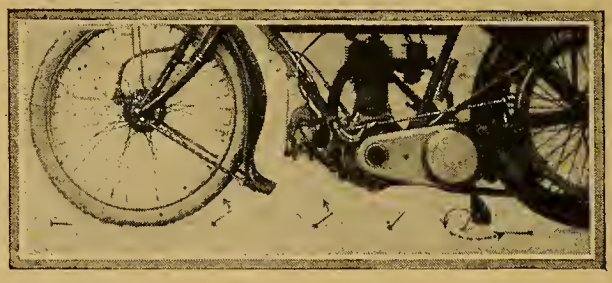
never crosses his mind. Any passenger outfit attempting a tour of the battlefields may be sure of a thorough testing, and it is not advisable for three people to try it on an old 3½ h.p. machine and wicker sidecar (as we saw attempted there by some sportsman), for inevitably trouble must come, as a good deal of kit and spares must be carried in order to ensure a satisfactory run. It is especially on such tours that one appreciates interchangeable wheels and large petrol and oil tanks, for garages are not always within reach, and, even then, do not always supply what is needed.

In conclusion, it may be said that if one does not appreciate English roads, it does one good to experience a week of what the despatch riders have faced under far worse circumstances for four years; and at the same time make a permanent photographic souvenir of one's life in France.

A Real Puncture Preventer.

By ROAD RIDER.

TYRES have been anathematised as the Achilles heel of the skilful motor cyclist. Given a good machine and a good rider, nothing else is likely to interfere with timekeeping, whether the ride be undertaken in competition, on business, or for pleasure. *Pace* Mr. F. L. Rapson, very little has been attempted to safeguard our journeys in this respect. Detachable wheels are hardly applicable to solo machines. Butt-jointed tubes are still imperfect. There is a limit to the nail-resisting powers of covers; the main difference between an old and a new cover is that, whereas the new cover will only surrender to a big nail, the old cover may admit entry to a tin-tack or a small flint. Various inventors have tried fitting chains or rubber shoes at a small clearance to extract partly-entered nails from the tyres; and the fact that not one rider in a hundred troubles to use such fittings is a silent commentary on their uselessness.



Showing how the deflector in front of the rear tyre renders harmless nails thrown up by the front tyre.

A new invention which strikes me as being of very great value, though it suffers from one obvious disadvantage of a minor character, stands to the credit of Mr. M. M. Monie, who is the surveyor of soils under the Board of Agriculture for the West of Scotland, and is compelled by his professional duties to travel thousands of miles annually on a motor cycle over roads which some of us know to be almost unequalled alike for their bad surfaces and their loneliness. In his first 11,000 miles, he sustained over forty punctures. This aggravating experience set his scientific mind to work, and he produced the device described below. It is cheap and simple; since he began to use it, he has covered upwards of 20,000 miles without any punctures at all. Inventors' private trials are apt to be regarded sceptically, but Mr. Monie's standing entitles him to a respectful hearing, and he is not without the reinforcement of plausible arguments.

Every rider knows that of a hundred punctures, about ninety-five occur in the rear tyre, and only five in the front tyre. It is generally supposed that this distribution is ascribable to the fact that the rear wheel takes drive and weight, whilst the front wheel takes weight alone. If this supposition were sound, we might expect the life of the two tyres to be in somewhat similar ratio; and estimating the life of a cover on the back wheel at 2,500 miles, we should almost expect to get $\frac{2,500 \times 95}{5}$ miles (say 40,000) out of the front tyre. In actual fact, we esteem ourselves lucky if we secure 4,000 miles from a front cover. If the mileage ratio between front and back tyres is as 8 : 5, and the puncture ratio is as 19 : 1, it is obvious that driving strains have little to do with the incidence of punctures.

The real explanation of the fact that front tyres hardly ever puncture is set in the subjoined sketches, which are self-explanatory. It is extremely exceptional for a nail to lie in the road with its business end uppermost. It lies flat. The front wheel of the motor cycle hits it, and tweaks it into an erect position. Before it has time to resume its repose, the rear wheel runs full tilt on its point, and a puncture occurs.

This is Mr. Monie's system. He fits a small deflector with a tiny ground clearance immediately in front of the rear wheel. The deflector is sufficiently flexible to bend backwards when it touches any projection from the road surface. But it infallibly sweeps aside any puncturing instruments which may have been tipped up into dangerous attitudes by the front wheel. In order to satisfy himself that the deflector would enable him to continue using a motor cycle satisfactorily, the inventor laid down 80,000 nails on a hard smooth surface, some of them at right angles to his track, some of them across it, and some of them higgledy-piggledy. He spent seven hours in traversing these nails, and, so long as the deflector was in position, not one of them so much as marked his tyres. When the deflector was removed, punctures began to come thick and fast.

The minor defect of the fitting, already alluded to, is its obvious tendency to stir up the dust.

It is a simple matter to test the efficiency of this preventer. Mr. Monie cut away the off side half of his first experimental deflector, so that one side of the tyre was left unprotected. He got several punctures in the unguarded side, as against no trouble with the protected side.

The device will shortly be advertised commercially; in the meantime a few are on sale (10s. 6d.) at "The Broford," 360, Great Western Road, Glasgow.

A TRAGEDY OF THE WAITING LIST.

CHAPTER I.

In which the ardent Rupert discovers that the path of true love runs smoothly if—

ONE, two, three—hesitate; one, two, three—hesit—hang it all, dancing is better than proposing. But no one can do both at once; not properly anyhow, and, as Rupert went to the dance to prop., there was nothing for it to declutch and go on full lock into the gara—pardon, the conservatory.

"Dancing is better than proposing."

Rupert felt fine and fit. Did not a letter from Cumfy Coachbuilts, Ltd., rustle in his pocket, telling him he was number nine hundred and sixty-four on the waiting list? Hope deferred perhaps—but still HOPE.

"Gwendoline, will you be mine?"

"Rupert, I cannot tell a lie—I will. But stay, as a proof of your love, you must achieve success; you must perform where others promise; you must show yourself a true cavalier. There is one little deed you must carry out. Promise me that you will do what I ask, and the answer is in the affirmative, as a lady M.P. (oh! how I wish I were one) might say. Tell me, Rupert, you will not fail?"

"My own, my ownest, I will do aught you demand. I am rich. Diamonds are yours for the asking. The choicest Chesterfields shall grace your parlour, demobilised Waacs shall bring you early morning tea, twenty matinées a month shall be your lot, and halls twice nightly in addition, anything—"

"Ah! Rupert, you know not what you promise. Mine is no ordinary request! Think, Rupert, think of the great deeds of history. Think of all that Mark Anthony essayed for Cleopatra—think of the wonders shown to the Queen of Sheba—think of the Field of the Cloth of Gold. Think of Philip of Spain and his Armada—think of the conquest of India—"

"Gwendoline, do not mock me!"

"Can you equal these deeds, my Rupert?"

"All these shall fade in the shade at what I will achieve for you! For you I will annex the Adriatic Coast, dispossess the Czecho-Slovaks, bring d'Annuncio himself bound captive before you. Ah! Gwendoline, you know not your Rupert—to dare all is to achieve all—and Rupert undertakes to deliver the goods, to bring home the pumpkin, to collect the ashes, to achieve the impossible—you have but to command! But, hark, the Foxtrot—let us not tarry!"

"Ah, Rupert, heartless that your are! Would you go to the Foxtrot when you know not my command. That which I shall require of you is a far, far greater job than you have ever done, and will require far, far greater skill than you have ever shown. Mark me well, Rupert. I like much your fair protestations, but should you fail in that which I enjoin—then I will have none of you; instead the suit of Sidney shall be favoured."

"Ha—ha! Would'st mock me, loved one? Would'st torment me with that horrid name? Speak, I pray thee. Say that which thou would'st have me do. There is nothing I will not dare. A house even—have I not an aunt who stands in the same butter queue as an old man who has a house to let? Did she not give him her extra ration once? She has but to demand a modest favour in return, and he must let her have the house—he can do no less—Gwendoline, just think, married, and with a house."

"—Rupert, it is not of houses I would speak. A house is easy beside the task I would set you to perform. Nerve yourself, Rupert, the suspense is killing me. Rupert, I must have a sidecar. It must have dinky cupboards, mirrors, screens, hoods, side curtains, dressing cases, luggage carriers, electric lights, detachable wheels, Triplex glass, cushions, cloth upholstery—in short, it must be *some* sidecar. Ah, do not speak—I know full well that your order has gone forth for such a one. I know your great wealth has been expended with a lavish hand as a deposit. All this I know, but *when* will it come? Ah, no, Rupert, do not buoy me up with false promises. Rupert, our union cannot be. I would fate had willed otherwise. Alas! Rupert, you must go your way and I mine. Farewell, Rupert, Farewell! *Sidney is number one on the waiting list.*"

CHAPTER II.

In which the resourceful Rupert conceives a plot for the undoing of unsuspecting Sidney, but is himself very thoroughly undone.

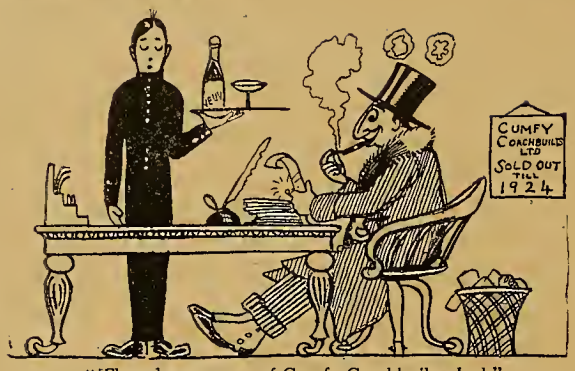
Rupert reeled from the ferny alcove alone, and, like one dazed, plunged through the ball room. Those who could sufficiently extricate themselves from the Bunny Hug turned their faces to gaze upon him, marvelling at his haggard look and wild eye. But Rupert heeded them not. Straight on he went—not even pausing at the bar. At high r.p.m. his feet carried him on—on—on. Rupert had a plan.

"Think of the Field of the Cloth of Gold."

* * * * * *

The sales manager of Cumfy Coachbuilts, Ltd. (Tel. address, Mustard, Brum.), sat gazing at his morning mail. Things were moving. Already the waiting list (each with a deposit) was of a length extraordinary. Ferdinand Flivver calculated that, if each waiting applicant were laid head to heels in a

A Tragedy of the Waiting List.—



"The sales manager of Cumfy Coachbuilts, Ltd."

straight line, the line would be curved and would stretch right round the confines of the local borough council's domains and then have a bit left over to begin all over again. "Sold out till 1924!" Delicious thought. And the deposits had already multiplied the assets of Cumfy Coachbuilts, Ltd., to a figure which made Ferdinand Flivver feel as though he were already a Napoleon of the sidecar industry.

In a word Ferdinand was pleased.

Life was good—his weekly salary was assured for quite a bit. He drew forth the cigar box in which reposed the choice Fumidoros kept as a bait for those about to place their names (with deposits) somewhere about in the third thousand of the waiting list. The light danced merrily on the superb Oriental colourings on the band round the Fumidoro. The effect was indescribably rich. It reminded Ferdinand of Cumfy Coachbuilts' standard finish, as shown at Olympia. Hang the expense. He took one—ah! what's that?

A knock on the door. Rupert entered.

Ferdinand blenched a little. He owed Rupert certain moneys, a debt incurred at Nap when travelling home after 1913 Olympia. Ferdinand hoped the war had washed out the memory of that deal. He gazed at Rupert's haggard look and turned the key in the petty cash drawer firmly, but as one in a dream.

"Rupert I cannot pay! Cumfy Coachbuilts, Ltd., are not war profiteers; alas! the rise in silver does not do us a good turn."

"Ferdinand, it is not your money I want. I will forgive all you owe if you will agree to one condition."

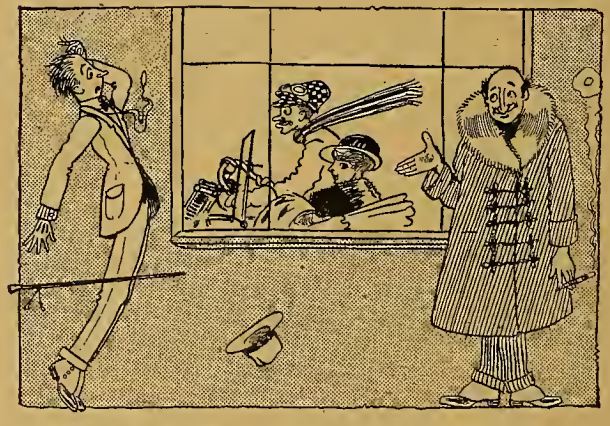
"Name it, Rupert, name it, and I agree!"

"Ferdinand, as perhaps you are aware, I am nine hundred and sixty-fourth on the waiting-list of Cumfy Coachbuilts, Ltd. Sidney Snaffle is number one. Change our positions and all you owe me is a write-off."

"Impossible. I wired Sidney yesterday to come and take delivery. He is now in the works—he has paid his cash. Ah, see, come to the window. He starts. His engine fires. And look in the sidecar—ah, Rupert, *what* a girl—"

But Rupert had turned paler even than when in the conservatory. He staggered forth—he forgot to collect his debt. He must for ever be on the waiting-list, waiting and watching. Waiting the long dreary years till the turn of number nine hundred and sixty-four on the waiting list of Cumfy Coachbuilts, Ltd., was reached—watching for something wherewith to furnish the sidecar whenever it should be ready. But 1920 damsels wait not for sidecarless swains.

MORAL: All delay is dangerous. M.F.W.S.

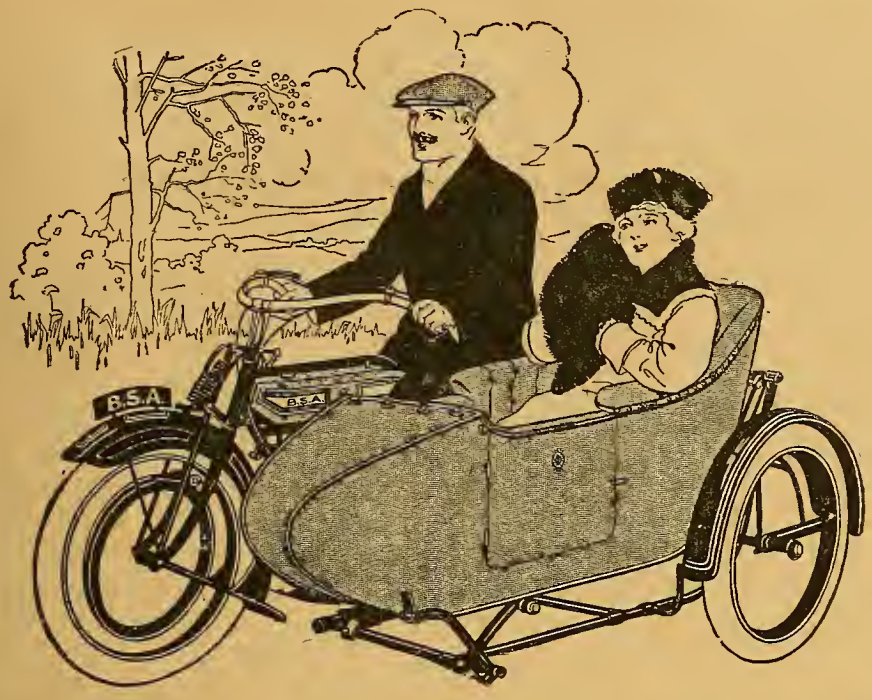


'But Rupert had turned paler even than when in the conservatory.".

THE MONOCAR.

Some Reasons for its Limited Popularity and Suggestions for Development.

PERHAPS one reason for the surprisingly restricted popularity of such monocars as have appeared is that the vehicles are quite a special job, and their designer must woo success by putting both cars and cycles clean out of his head. For example, if a four-wheeler is intended, it is perfectly hopeless to rely on standard wheels and tyres. Four wire wheels, with 26in. × 2½in. tyres, will make too big a hole in the available cash; moreover, unless they are very widely spaced in the track, they will not afford anything like the comfort of a motor bicycle. On the other hand, if the gross weight of the machine can be kept down to the standard of a 7-9 h.p. twin, and this load is to be distributed over four wheels instead of two, quite small tyres will serve; and perhaps wheels of large diameter would modify the springing problem. Arguing on these lines would lead to some such scheme as 40in. wheels, shod with 1in. tyres, which would only be possible if disc wheels were pressed out of steel and heavily perforated for lightness. Incidentally, this construction would raise the driver to a level at which passing bullocks could not kiss him. These foolish suggestions are not meant to be taken seriously. I merely wish to suggest that there is a big potential market for monocars; that this market is very sensitive in the matter of price; and that a designer who attempts to cross the motor cycle with the motor car may possibly combine the worst points of both vehicles. Machines of the Carden type have obviously possibilities for the all-weather soloist, yet for some mysterious reason their sales have never even distantly approached the presumed number of such riders. Why is it? ROAD RIDER.



BIRMINGHAM SMALL ARMS CO. LTD. TRADE MARK BSA BIRMINGHAM

Winter Riding.

THE keen enjoyment of motor cycling with a B.S.A. on a winter's day is without equal. The hard roads, winter air, and the comfort and easy running of the reliable B.S.A. all make for thorough enjoyment. The sturdy construction of B.S.A. Motor Bicycles and the searching tests to which each individual machine is subjected before finally leaving the B.S.A. factory is a guarantee of the satisfactory service that can be confidently anticipated from

MOTOR BICYCLES

For Solo and Sidecar.

B.S.A. CYCLES LIMITED, BIRMINGHAM.

Proprietors : The Birmingham Small Arms Company, Limited.

A Message of Hope & Goodwill to Every Motor Cyclist

The new "TAN-SAD" Motor Saddle loves Pot-holes. The faster you go over Pot-holes the more it likes it; The machine likes it too, and simply dances with joy.

See What We Save You

Absolutely all shock: An enormous amount of repairs: Many more miles to the gallon on rough roads: And, lastly, you will find a pleasure in motor cycling that nothing has ever given you before—you will love your TAN-SAD and thank us for evermore.

Just as its marvellous springing system makes the Rolls-Royce the acme of car perfection, so the TAN-SAD Motor Saddle lifts motor cycling to an entirely new plane of pleasure. Words can only suggest the improvement. Experience will confirm it to you.

So send for descriptive list and order quickly to ensure prompt delivery. Price **38/-**

Remember, also, the TAN-SAD patent Pillion Seat which makes Pillion riding safe and comfortable. Price **38/-**

And the TAN-SAD patent Rear Lamp which can't help lighting. Price **6/6** or **7/6** with number plate.

Sold by all Dealers. **Write now for full particulars to Sole Makers:**

"TAN-SAD" Works (F. H. Headley), **9, Freeman St., Birmingham**

In answering this advertisement it is desirable to mention "The Motor Cycle."

TALES THAT ARE TOLD

Some Legends of the Road and the Phantoms that use them.

The shade of Dick Turpin is supposed to haunt a hollow of the road near Warrington.

IT has been said that the mechanically propelled vehicle has robbed the roads of their romance. Rather should it be said that the motor has revived it. Before the advent of the motor cycle and the motor car, the roads had merely become byways between villages—the great highways were the steel rails upon which people travelled from place to place. To railway travellers the country between home and destination is unknown, and to them travelling is a bore. All that is now altered; with the aid of a motor cycle, a holiday begins at one's very door, and not least among the pleasures of a vacation are those associated with the road along which the journey has been made.

Almost every hamlet, village, and town in England has its legend, whilst most districts can claim a lonely stretch of road with a history and a ghost. At this time of the year—in the depth of winter and with Christmas about us—anything appertaining to the supernatural forms an absorbing topic in many households. It is, perhaps, only natural that this particular season is singled out as the time for ghost stories. During the glorious weather of the summer, its long days, its flowers, and its birds, one would find it exceedingly difficult to conjure up a suitable atmosphere for the telling of a story in which the leading figure is a headless horseman, a hooded monk, or the shade of a murdered bride.

True, one often hears such stories during the summer rambles with the motor cycle, but the retelling is reserved for the dreary winter evenings, when chairs are drawn up to a blazing hearth.

It is not altogether surprising in view of this fact that the majority of ghost stories are connected with the Christmas festival. Most legends of this nature are timed somewhere between midnight on Christmas eve and the same time on Christmas night.

A Prolific Period.

Another remarkable feature is the fact that most ghost stories are confined to the Elizabethan and Stuart periods. In a few isolated cases we have knights in shining armour, and at the other extreme side-whiskered earls in top hats and frock coats, but one rarely hears of Crusaders or Roman soldiery taking a part in these tales of long ago, which are supposed to be reacted for the benefit of the present generation generally by the spirits of departed victims of foul play.

In Warwickshire, somewhere near the old Fosseway, a ghost carrying its head under its arm is said to run across the road.

Some Necessary "Properties."

Doublet and hose, rattling chains, highwaymen and gibbets, dungeons deep, skeletons, coffins, swords and daggers are some of the

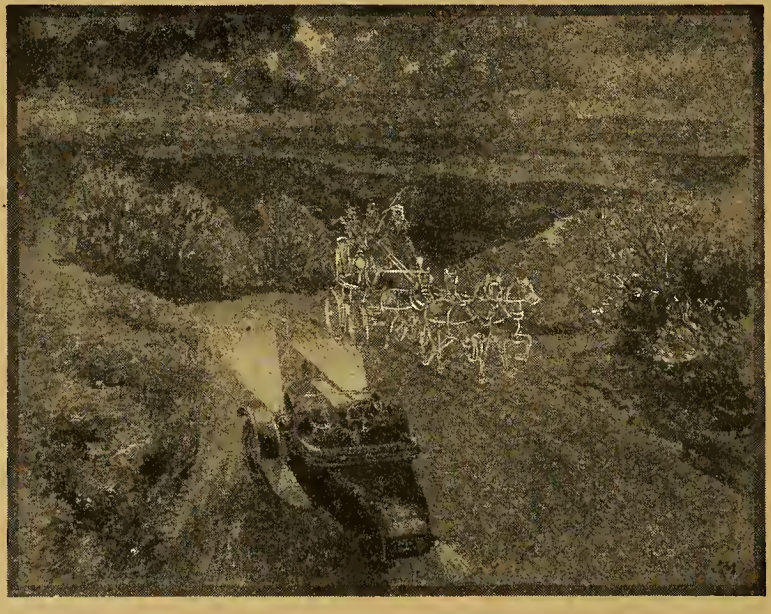
most important "properties"; the ghost story will have to be properly staged. The early Victorian period appears to be sadly neglected, for one seldom hears of ghostly figures in crinolines and peg tops; hence, it can be said that this was a period dividing the old romantic days and the era of the steam age, and that the latter killed most romance by diverting the main traffic from the highways.

One of the most fascinating figures in romantic history is Dick Turpin, who, but for his famous, even if legendary, ride to York, and the death of his faithful mare, would have been lost to fame with many other rascals of the same ilk. To motor cyclists who have competed in the London-Edinburgh run, Dick Turpin's ride is particularly interesting, since he used the Great North Road, but it is doubtful whether any aspirant for an M.C.C. "gold" has ever been asked to "stand and deliver" by the shade of a masked horseman.

No doubt many of the legends of the famous highwayman rightfully belong to other robbers of that period. Thus, we hear that other districts than those through which the Great North Road passes claim the distinction of a connection with him.

The Spectre of Dick Turpin.

There is, for instance, a road turning off the Knutsford high road which leads to Warrington. Some little distance from the high road there is a wooded hollow where, tradition says, Dick Turpin waylaid anything that came along. This hollow is said to be haunted by the shade of the highwayman duly booted and spurred.



Another road-haunting ghost is that of a coach and four said to appear on certain parts of the Old Colwyn Road. Why and wherefore tradition appears silent.

The sailor ghost of Hindhead is a popular superstition, probably kept fresh in the minds of the present generation by the stone which marks the spot where the said sailor, when in the flesh, was done to death. It is said that the ghost appears fairly regularly to passers-by on any night that the sky is cloud-wracked and a watery moon is sailing. It is also reputed that it generally appears from behind the stone that records the details of the murder. The ghost appears with the plaited hair and rice bag trousers of the sailor of that particular period. It is satisfactory to remember that the murderers were hanged on the hill just above this point.

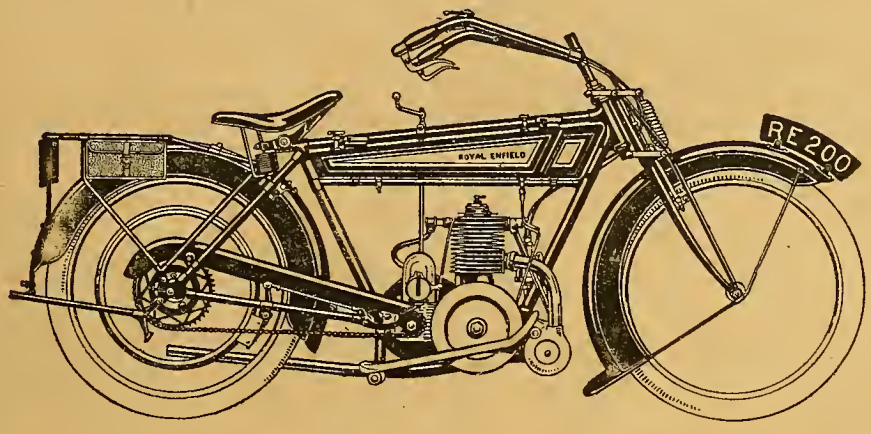
Another well-known ghost is that which is said to haunt St. Leonard's Forest. Nothing much is known of this spectre, and the reason of his restless wandering is shrouded in mystery. It is said to be the spirit of a certain Captain Powlett, of the Horse Grenadiers, and it is alleged to wander this forest side with its head under its arm. According to history, Captain (or Squire) Powlett lived a most exemplary life, and was certainly not beheaded, but died naturally in 1746. One comes across legends similar to this in many parts of the country. The headless figure, carrying its head under its arm, lends itself to artistic treatment on the tongue of the superstitious yokel. In Warwickshire, somewhere near the old Fosseway, there is a picturesque farmhouse, with an old church forming part of a barn. A little distance away there is a coppice, and between this and the ancient building a ghost carrying its head in its hand is said to run on certain nights of the year.

A Personal Experience.

The writer has had one experience which may not be out of place in this article. It occurred in the Midlands while riding home on a motor cycle late one moonlight autumn night. Having dismounted at the top of a hill locally reputed to be haunted, but by what has never been made clear, the shadow of a gallows with something dangling from its arm was distinctly seen on the road. It is to be confessed no effort was made immediately to investigate the matter. Next day a return was made to the spot, but nothing that would cast such a shadow across the road was to be found. Probably there is a great difference between what one sees, and what one thinks one sees. The knowledge that a particular place is reputed to be haunted may have much to do with the matter, although the writer cannot remember thinking of this at the time of the incident alluded to.

Then there is the legend of a ghostly coach and four which silently passes along the Old Colwyn Road. The old stage coach makes a good setting for a ghost story, but, on the other hand, the monster railway engine does not appear to figure in stories of the supernatural. Neither is the up-to-date steamship called upon to play the part of a phantom ship, but one hears stories of the supernatural in which the motor cycle or motor car is introduced. Such stories are occasionally told at Christmas time—perhaps more to keep alive the spirit of Yuletide and to bring it up-to-date than with any intention on the narrator's part to lead their listeners to believe that the stories are true.

VEDETTE.



The 2¼ h.p. ROYAL ENFIELD
Two-stroke Motor Cycle.

Described by *Motor Cycling* as being
"*Essentially a no-trouble Mount.*"

Specification includes the Enfield two-speed and free engine gear, all chain drive, and the A.M.A.C. single lever automatic carburetter.

In answering this advertisement it is desirable to mention "The Motor Cycle."

ealing with the many and various h.p. Clyno the finest Motor Cycle

Its Power Unit

Our illustration indicates the very neat appearance of the twin-cylinder 8 h.p. air-cooled

CLYNO

Engine. An entirely new feature in Clyno practice is the equipping of this power unit with Detachable Cylinder Heads. Again, an unusually interesting point is its ingenious exhaust lifter mechanism, all the Bowden working machinery being readily accessible outside the engine, and easily removable for replacement. Each Sparking Plug is situated in a pocket of its own directly over the inlet port, the valve caps being thus unhampered. Lubrication is by a vane-type mechanical pump—the oil being driven from the tank via a sight-feed regulator. From the pump the oil passes to the front cylinder and thence by splash to other parts. Plain bearings to Mainshaft; four-row cage roller bearings to connecting rods.

Our next advertisement will deal with the Gear Box.

Sunbeam Motor Cycles with Perfect Power Transmission.

The 1920 3½ h.p. Sunbeam possesses many Innovations and Improvements which cannot be obtained in their Entirety on any other Motor Cycles

1. The Wheels are instantly Detachable and Interchangeable.
2. The Transmission is Weatherproof and Trouble Free.
3. The Leaf Spring front fork is of Sunbeam patented design and manufacture.
4. The Gearbox is a "Sunbeam" Gearbox made at Sunbeamland exclusively for the Sunbeam Motor Cycle.
5. The 3½ h.p. Model will take a Sidecar anywhere.
6. The Bearings of Engine and Gearbox wear almost indefinitely, and the machine has earned the title amongst a large coterie of motor cyclists as the "Rolls-Royce" of the Motor Cycle World.

"Presently I sighted the dust of a big car, perhaps a mile and a half ahead, and down went my nose on the lamp bracket."

A Queer Christmas.

THE STORY OF A CREDULOUS SPEEDMAN.

THE s.s. *Orient Queen* was slowly boring her majestic way through the Eastern Mediterranean with 2,000 assorted troops on board. Though they were proceeding homewards for demobilisation, the passengers' feelings were somewhat mixed, for the night was Christmas Eve. On the one hand, it was certainly good to have done with the Army for ever, or so they fancied, for yearnings after the old khaki comradeship do not begin on the voyage home. Yet for most of them, sailing orders had come a good fortnight too late. Home in large doses is apt to be boring; but few of the *Orient Queen's* passengers had seen home for four years or more, and, anyhow, home has a trick of pulling at one's heart-strings towards Christmas time. There were scraps of every fighting unit "out East" below the decks; but few were boisterous, even of those who did not feel the return to heaving open waters after the peace of the Suez Canal. In fact, three officers, lolling in a small cabin, bore every appearance of being thoroughly bored with life. The colonel was idly glancing over a month old copy of the *Times*, which had come aboard at Port Said.

"So Lord Mintshire's got his decree all right," he drawled presently. "Awful bad lot that woman must have been. Did you read the butler's evidence?"

Majors ought not to interrupt colonels, even if the colonel belongs to another regiment and is half-demobilised at that. But the major was not interested in the ex-Lady Mintshire's morals; so he interrupted—with a yawn, too.

"Queer place this to spend Christmas," he said wearily.

The doctor knocked out his pipe, with a grim reminiscent smile.

"I've spent one in a queerer." He spoke with a curious emphasis. The major looked up quickly.

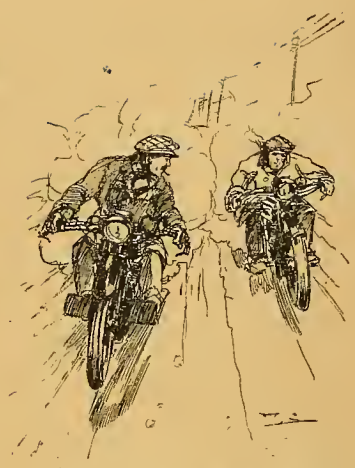
"Blenkinsop for a yarn," he demanded.

The colonel reluctantly bade farewell to Lord Mintshire's matrimonial miseries. "Let's have it, Blenk; the drinks are on you if it's a slow tale." So Blenkinsop began.

* * *

"My old dad knew all there is to be known about wool, and precious little about anything else. S'pose that was why he sent me to Cambridge to learn medicine. 'Varsity did a lot for me. Played footer fairly well; owed pots of money; acquired original and expensive tastes in dress; got a degree of sorts; but learnt no medicine. Right at the finish—the very last week—there was a ball. There may be men who can share a punt down the Backs by moonlight without making asses of themselves. I couldn't. Least of all with Dolly. Any greenhorn would have found her irresistible. Tremendous blue eyes. Slim little figure full of twisty little wriggles. Laugh like a bell. Yellow curls always blowing about and having to be patted back into place. I proposed—there'd been champagne, you understand. She accepted. I walked home on air. Next morning snags developed. Her papa frightfully rich; I just a raw young sawbones with a fifth-rate degree and no particular prospects. Decided I should go down to Winchester and interview her papa, whilst her angry auntie whisked her back to town.

"I decided to ride down on my Triumph motor cycle. Thought it might cool my head. Got off early, and let her rip. Began to feel better. An hour or so blew the fumes of Dolly and the fizz out of my noddle, and I began to sit up and take notice. Presently I sighted the dust of a big car, perhaps a mile and a half ahead, and down went my nose on the lamp bracket. I'd done perhaps a mile at quite a tidy speed when there was a roar and a rattle alongside, and some other bicycle shot past as if I'd been standing. Well, my old 'bus was only a roadster machine, but she was in pretty decent tune and game to touch 55 m.p.h. on

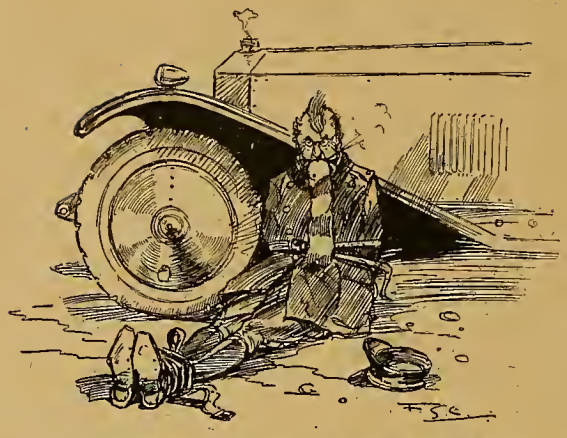


"'D'you mind if the fellow's armed?' he bellowed, as our engines accelerated with a thunderous roar.

"'Not I,' I cried recklessly. So we got our noses down, and we fairly ate up that straight white road."

". . . put up the best imitation of a speedman's wobble I've ever seen. Goodness! how he swerved and wobbled! He scared me stiff, I thought he'd be killed."

A Queer Christmas.—



"As his language was beyond all barrack standards, we shoved the end of the scarf in his mouth as a silencer."

the straight anywhere. I was some narked, I can tell you, but I'd hardly time to wonder what had mopped me up so easily when the other fellow began to slow down and shot out his left arm across me as a signal to stop. I thought it was pretty cool cheek to mop up a fellow like that without giving me a chance to get my own back, but I wanted to spot what he was on before I challenged, so I throttled down.

"As for him, he didn't wait to slow his 'bus right off. He jumped down when she was still doing a cool twenty, I should think, and he had to gallop like a hen to stop her dragging him over. I cocked my eye at him as I came up, and I saw he was on a Brooklands Norton—they can do seventy, you know, so I wasn't going to take him on any more. He looked all right too. Grey flannel breeks, Norfolk jacket, a club tie, big woollen scarf of some rowing colours, seemingly, and a decent cap. He was all flushed and panting.

"'Can you fight?' he gasped, as I got off alongside.

"I began to think he'd broken out of an asylum.

"'Try me,' I said, looking for a soft spot to drop my Triumph on.

"He was breathing so heavily he could hardly speak.

"'No guff, old man,' he pleaded between his gasps, 'I'm not ragging. Did you see that big car on ahead? That's my governor's Rolls. It's been pinched. Fellow nicked it out of our garage while everybody was at breakfast. I thought it'ud be pretty smart to get it back while the police were gassing round doing nothing. So I followed the tyre marks on the road, and here we are. Come along and help.'

"This was a lark with a vengeance.

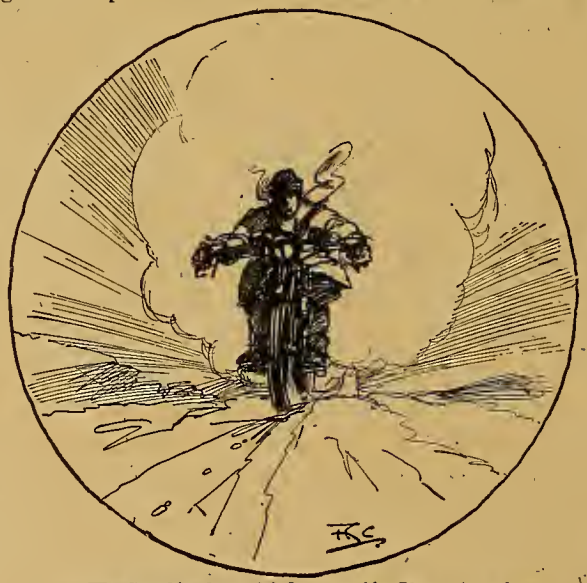
"'I'm your man,' I said eagerly, 'but my 'bus can't hold yours. Fifty-five's my limit, and you can put a good ten on to that.'

"His face brightened into one big merry grin when he found I was game.

"'That's all right,' he stuttered, still gasping with excitement, 'you're plenty fast enough to hold the Rolls—she's not in extra tune.'

"We were both in our saddles again, quick as lightning.

"'D'you mind if the fellow's armed?' he bellowed, as our engines accelerated with a thunderous roar.



"The Brooklands model does a pukka 70 m.p.h. at least, if Bonniksen speedometers do not lie."

"'Not I,' I cried recklessly. So we got our noses down, and we fairly ate up that straight white road.

"Presently we sighted the grey dust-cloud again. It had picked up a mile or two while we were talking, but the scoundrel wasn't travelling particularly, and we managed to gain on him at a pretty tidy rate.

"Well, some ten minutes' hard riding put us right on the heels of the Rolls, and rather to my surprise my pal hooted at her (I thought he'd have tried to slip past). The thief in the car drew in to his near side—evidently he hadn't a notion that we were after him. Both of us tore past, and when we got, say, fifty yards ahead, my pal put up the best imitation of a speedman's wobble I've ever seen. Goodness! how he swerved and wobbled! He scared me stiff, I thought he'd be killed. The Rolls man thought so, too, for he took his foot off the accelerator. I shut my throttle, while the Norton man was apparently fighting to get control of his 'bus. He slowed her down right enough, but the slower she went, the more she wobbled, and, at last, he crashed off, with the bicycle lying right across the middle of the road. I braked hard, dropped my feet, and pulled up level with him, and the Rolls slid up and came to a stop too. I looked at the thief, and saw by his goggling, astonished eyes that he never suspected us of being on his track. But the instant the Rolls stopped, the Norton man wriggled clear of his fallen machine, and, shouting to me, fairly flew at the Rolls driver. I'm not generally slow, but he'd got the thief half throttled before I'd dropped my Triumph and clambered on board the car. The cute rascal was dressed in a chauffeur's livery to avoid suspicion, too. We had him trussed in no time; the Norton man's scarf came in handy for that, and the straps off the hood did the rest. As his language was beyond all barrack standards, we shoved the end of the scarf in his mouth as a silencer. Then the Norton man and I shook hands and roared with laughter.

"'What's the next item?' I asked. 'Take this ruffian on to the next police station, and then hey for a drink!'

"The Norton man's face fell. 'Well, to be quite frank,' he said, in rather a pleasant voice—he'd got his breath back, now, you know—'I'm particularly keen on delivering the goods at

A Queer Christmas.—

home myself. Our local cop is a pestilent fellow—he's had me for furious riding more than once. Look here. What d'you say to coming back to lunch—here's my card. Dad'll be awful pleased to make your acquaintance. We can shove your Triumph in the back of the Rolls, if you care to sample my 'bus.'

"Dolly rose up in my memory.

"I told Ashburton—that was the name on the card, Edgar Ashburton, Coldford Hall, Yiewslip—that I was due at Winchester to request the honour of a lady's hand, but that I'd be charmed to put up with his people the next night. Then we compressed our trussed thief into part of the remaining space, and covered him up with rugs. Then we bade each other a fond farewell. Ashburton made tracks north-east with the Rolls, plus the malefactor and my Triumph. I burbled south-west on Ashburton's Norton, and found the advertisements are quite O.K. The Brooklands model does a pukka 70 m.p.h. at least, according to the Bonniksen speedometer reading.

"While he was pouring the juice into my tank I started to tell him what I thought of garages."

"She ran so charmingly that I forgot all about the drink I had promised myself, and did not stop till I got a little anxious about petrol.

"I found a garage, dropped my feet outside, and shouted. Nobody came, and at last I pushed the 'bus inside. A man was speaking at the 'phone inside a little glass office, and I got quite cross before he came out. When the fellow condescended to come and ask what I wanted, he was unconscionably slow about getting it, and I got rather riled. While he was pouring the juice into my tank I started to tell him what I thought of garages which treat motor cyclists as beneath their attention. I'd just got fairly wound up when a heavy hand fell on my shoulder. I looked round and there were two enormous policemen, one on each side. They pinched Ashburton's Norton and they pinched me. Before I knew where I was, I had been charged by an inspector fellow, and was safely locked up for the night in cells, common drunks, for the use of, one."

"But, good heavens, Blenk!" began the Colonel in astonishment. "The charge, of course," explained the Doctor, "was stealing one perfectly good Brooklands Norton motor bicycle."

"I don't quite get you," objected the Major.

The doctor proceeded.

"Next morning the charge was extended to include the theft of one perfectly good Rolls-Royce, Edinburgh model, with sporting body. I was hauled out of my cell, and confronted with a pallid, much-bandaged, but wholly irascible individual, whom I instantly recognised as the scoundrelly rascal whom Ashburton and I had sandbagged on the Rolls. It transpired that he was the lawful chauffeur. He was accompanied by—saving your presence, sir—the most choleric, purply-cheeked colonel I have ever seen, to wit, the bereaved owner of the Rolls.

"Then Ashburton . . . " enquired the Major intelligently.

"Exactly," murmured the Doctor admiringly; "Ashburton, whose real name was something quite different, was undoubtedly the super motor thief of his generation. He deposited the trussed chauffeur in a deep and nettlesome ditch about a mile from the scene of our joint outrage. He then disappeared off the map at high speed.

"Of course, you were able to clear yourself?" asked the Colonel.

"How could I?" retorted the doctor testily. "I was not convicted of pinching the Rolls, principally because they never found it. But I was caught red-handed with the Norton, and they made no bones at all about giving me twelve months for that."

"You didn't *serve* it?" said the Colonel, incredulously.

"I served six and a half months of it," replied the doctor grimly. "By that time immunity had encouraged the ingenious Edgar to get rather too fresh. The impudent fellow actually opened a West End mart to dispose of his stolen cars. They collared him at last in the act of tooling off a Guardsman's 27-80 h.p. Austro-Daimler from the stage door of the Frivolity. When he saw he was in for a good stretch anyhow, he was sport enough to clear me. I went to see him at Pentonville, when I received what the law is pleased to call 'His Majesty's gracious pardon' for a crime I had never committed. He got the D.C.M. in Gallipoli, and went west during the awful November blizzard. Incidentally, it was the middle of January when he cleared me. A man who has spent Christmas in gaol may surely say there are worse places than a troopship, eh?"

"By gad, yes!" agreed the Major.

The Colonel was elderly enough to prefer romance to adventure.

"What about the fairhaired Dolly all this time; you were on the way to interview the obdurate parent when you met Ashburton?"

"Dolly!" said the doctor. "Oh, she married Mintshire before they let me out. Mintshire was up at Trinity with me.

"Lucky riddance for you," said the Colonel with conviction. "I think the drinks are on me." And he pressed the bell.

B. H. DAVIES.

UNITED STATES NEWS LETTER.

Old Name to be Revived; New Make to be Introduced. Harley and Excelsior have New Models with Larger Engines. Smaller Diameter Wheels but Larger Tyres Favoured.

MORE proof of the tremendous awakening of motor cycle interest, following the return of four million men from Army service, and their desire for out-of-door sports, may be gleaned from the fact that a machine of a new make and another that has been off the market for five years will soon be ready for delivery. The latter is the Eagle, a motor cycle made in Brockton, Mass., with a limited following. The newcomer, which is being made in Philadelphia, has been named the Ace. It has been designed by William G. Henderson, of four-cylinder motor-cycle fame, and deliveries are promised about February 1st. Rumours are rife that the Ace will create a furore when it appears. The Ace factory will not bring out a yearly model, but will pattern after automobile practice, and announce new models as the need of improvement in design becomes apparent.

The Harley-Davidson Co. is experimenting with a larger motor. A very fast and powerful Harley-Davidson has been seen in local hill-climbs. It has a piston displacement of over 1,100 c.c. This motor, known as the C.A.B., has been sold to dealers exclusively, and only a privileged few at that. Possibly, it is this motor, with lower compression, that will be the Harley-Davidson contribution towards larger engines.

Detail Improvements.

The valve diameters of the Reading-Standard have been increased by a quarter of an inch. This is the principal change, the rest of the improvements being along refinement lines.

Splashboards, introduced on the American market by Harley-Davidson, are becoming popular with the all-weather riders in the States, and, with a few bends in the boards, or brace, that holds the accessory to the motor cycle frame, they may be fitted to any make.

The Harley-Davidson policy has ever been to hook up the rider with the dealer in more ways than merely selling motor cycles or sidecars. These folk have a complete line of riders' needs, from gloves to sidecar robes, all carrying the Harley-Davidson shield trade mark, and sold in their agencies exclusively. The goods are all of the highest quality, and adapted to motor cyclists' needs. The cost is reasonable at all times, and the result is that this co-operation on the part of the factory with the dealer and rider has resulted in a vastly neater garbed motor cyclist.

The Excelsior retains the familiar overhead intake valve engine, that has been refined and improved but little since it first came on the road in 1912. The motors will be made in two sizes: 1,000 c.c. piston displacement, with the usual bore and stroke, and a newcomer that will rate about 1,100 c.c., for it carries a 101 mm. stroke. This fills a demand for a more powerful motor for sidecar work that has been insistent among motor cyclists since sidecars leaped into popularity. Both of these motors, so it is rumoured, will be fitted with larger diameter valves than in the past.

The well-known Excelsior type of frame will be retained, but the spring loop front fork with bell cranks taking up road shocks, that has been used on the Excelsior since 1912, will be discarded in favour of the Henderson fork. The later fork is of the castor or trailing wheel type, with a rigid fork, sprung fork, and rocker arms carrying the axle. The Henderson fork is made of heavy fork side material that can withstand all side thrusts and road shocks, and is of ample width to take an oversize tyre and set of Weed skid chains.

A Change in Wheel Sizes.

Henderson handle-bars will be used, and this means the discarding of the rod system of throttle and magneto control. Rods will be used on the handle-bar clutch control, for this exclusive Excelsior feature is one of the best fitments on American machines, affording absolute mastery of the clutch without removing the hands from the bars at any time.

All 1920 Excelsior motor cycles are to be fitted with smaller rims, permitting the use of 27×3½in. tyres, with a resultant lowering of the saddle position. This will be hailed with delight by the Clan Short-legged, for a few years back a motor cycle with a low saddle position was as scarce as a special sale in a post office, and machines were all made in one leg length. Thus the customs change.

Another departure from standard is rumoured in the matter of ignition and lighting. With the 1920 models, Excelsior is to be equipped with separate magneto and generator, instead of both incorporated together as at present. *Très bien.*

And now we come to the Henderson, known by that shorter and more affectionate term Hen. The 1920 Henderson will be engined with the same type of four-cylinder motor that always characterised this mount as different. It is to rate along in the neighbourhood of 76 cubic inches piston displacement, with side-by-side valves and a lot of oversize parts in the innards. The crankshaft will be 3in. longer; there will be no offset in the connecting rods. The bearing surfaces for the connecting rods will be three-sixteenths larger, while wrist pins will be one-eighth larger in diameter. The motor will be longer in stroke and shorter in bore than at present, and the crankshaft will be hollow, with force feed lubrication. That is making for positive oiling of important parts, and is a real step ahead in motor cycle design. Bearings are of bronze, with white metal facings.

A Revived Racing Engine.

The Henderson Four, like the Excelsior twin, will be equipped with 27×3½in. tyres, which will give the Henderson the lowest saddle position of any of the big machines now offered on the American market.

For the 1920 campaign of dirt track or speedway racing, the Excelsior is experimenting with the well-known and speedy Cyclone motor, that flashed across the American horizon like a comet a few seasons back. The Cyclone has plenty of hop in it, and is an overhead valve motor with valve mechanism actuated by shaft drive to overhead cams. When the Cyclone was in evidence on the track in 1914 or so, it was an amazingly fast sprint machine over the shorter distances, which is a mark of the overhead valve engine. Excelsior engineers are putting staying qualities into this rejuvenated Cyclone, and it will be seen in action in several speed events during the coming year.

After lingering on the edge of oblivion for several seasons, the Thor motor cycle has gone to its rest. The Thor was one of the pioneer American makes, and played a large part in the early history of the pastime, but since 1913 it has been losing popularity with the riders. Made by a company that did not have every interest tied up in the motor cycle industry—for the makers of the Thor are big producers of automatic machinery—the design did not keep closely to riders' wants, and although the engine was powerful and material and workmanship of the best, Harley-Davidson, Indian, Henderson, Excelsior, and Reading Standard outstripped the Thor in appealing to the exacting demands of riders. It was but a question of time when the Thor would go off the market. Now it has happened.

An Unhealthy Condition.

It is to be regretted that the American market is being limited gradually. We have six makes of varying popularity that cater to riders' wants. There are four twin-engined motors, one four-cylinder, a flat twin, and a two-cycle motor that lets us out on engines. Cleveland makes the only two-speed machine on the market, the rest all being three-speeds. Controls will soon all be of wire, for Excelsior is planning that change this coming year. In frames, we have three "keystone"—two loop and three duplex. Going back to motors, there are overhead intake and side-by-side valve motors. Variety is the spice of life, they quote some wise bird as saying—well, the British motor cycle market may have that spice; obviously we Americans do not get it.

And last, but not least, one make of carburetter takes care of the entire American market. How's that for an unhealthy condition of trade, and a discouraging of advance in carburetter design?

You British riders do not know when you are well off. You can pick anything from a light T.T. model, stripped to the bone for fast rolling, up to a de luxe sidecar outfit, hung about with fitments in such variety that it is like a Christmas tree on the morning of December 25th.

E. B. HOLTON.

GREENWICH TIME.

Dec. 25th	...	...	4.23 p.m.
,, 27th	...	...	4.25 ,,
,, 29th	...	...	4.27 ,,
,, 31st	...	...	4.28 ,,

Greetings.

A merry Christmas to one and all of our hundred thousand readers, and to the several thousands over who have recently become our friends.

Westward Ho!

Competitors in the London-Exeter run should read A. E. W. Mason's account of a ride over this road in "The Watchers." It would add a zest to their trip. By the way, this author shows a nice appreciation of roads in more than one of his books.

Prize Draw for Motor Cycle.

The winning number in the Ravensthorpe (Dewsbury) Ambulance Prize Draw for a 2½ h.p. Metro-Tyler two-stroke motor cycle is 24,287. The holder of the ticket bearing this number should communicate at once with the secretary, Mr. W. Ledgard, 42, Broomer Street, Ravensthorpe, Dewsbury, Yorks.

Disposal of W.D. Machines.

A question was asked in the House of Commons recently regarding the number of motor cycles sold through the War Motors Association since August last. The reply of Mr. Kellaway was that 484 machines had been purchased by the Association mentioned, while the number otherwise disposed of by the Ministry of Munitions (Disposal Board) was 6,011.

North-west London M.C.C.

We were recently informed by a reader that he won two cups at the last Brooklands meeting organised in 1914 by the above club. Owing to the outbreak of war, there was no distribution of awards in that year, and consequently the trophies are still unclaimed. Our correspondent would like to get in touch with any of the former officials.

The Lighting Regulations.

Errors in interpreting the rules regarding rear lights are generally found on vehicles propelled by human or equine agency, but a few nights ago we followed for some miles a motor van which displayed a bright white light to the rear in addition to its red light. Such lights are confusing!

While on this subject, may we ask why it is that when a cyclist has no red light (this is, we are glad to say, becoming less common), and is riding with a friend who is properly equipped, he almost invariably takes the outside position? One would suppose that common-sense and the instinct of self-preservation would suggest to him the advisability of keeping next the hedge.

Since 1903.

This issue completes the twenty-third volume of *The Motor Cycle*, which has had an unbroken run for 874 issues.

Scare Headlines.

Apparently the end of the world, so confidently predicted by some people to take place last week, has, like a drought once foretold for a certain summer in Australia (which summer proved to be the wettest on record), been postponed owing to the inclemency of the weather. Those of our readers who threw away all their petrol as being dangerously inflammable for such an occasion will have to purchase fresh supplies.

The A.C.U. Paid.

One of the most useful facilities enjoyed by motor cyclists who are members of the Auto-Cycle Union is that of free legal defence and advice. A week or two ago the Union fought a rather involved case in the Courts on behalf of a motor-cycling member. The case concerned a charge made against a motor cyclist of riding an unregistered machine and displaying false identification numbers, and he was convicted by the magistrate on both counts. The A.C.U., through its solicitor, lodged an appeal, and prepared to produce evidence that the motor cycle was registered, but the application was dismissed as being frivolous, and the £50 recognisances that had been paid into court was accordingly sacrificed. Had the motor cyclist not been a member of the A.C.U. it is most probable that he would have been involved in a heavy pecuniary loss in connection with the case, but in accordance with its invariable rule of championing what it considered was a good case, the Union bore the £50 loss involved.

THE CHRISTMAS TRIALS.

OF the two Christmas holiday events which will be run this year, probably the London-Exeter run organised by the M.C.C., is the better known. It is as "classic" as the T.T. and the A.C.U. Six Days, with which it may be said to form the triangle of types of motor cycle competitions. The first trial was held on Boxing night, 1910, and was the outcome of a suggestion which appeared in *The Motor Cycle* from the well-known competition enthusiast, Mr. W. Cooper.

The 300 odd miles run starts and ends at Staines, and a 20 m.p.h. (approx.) schedule is fixed as below, the times given being those of the first competitor:

	Miles		Time p.m.
Staines	0	..	8
Bagshot	9½	..	8.31
Blackwater	15½	..	8.46
Hartley Row	21½	..	9.5
Basingstoke	29	..	9.34
Andover	47½	..	10.37
Salisbury (arrive)	65	..	11.30
(Sign check sheets. One hour stop at White Hart Hotel.)			
			a.m.
Salisbury (leave)	65	..	12.30
Shaftesbury	86½	..	1.42
Sherbourne	104½	..	2.36
Yeovil	108½	..	2.55
(Petrol and oil replishments at Yeovil.)			
Chard	125¼	..	3.47
(Non-stop to top of hill.)			
Honiton	138¼	..	4.33
Exeter	154½	..	5.24
(Sign check sheets. Breakfast at Bude Hotel.			

RETURN JOURNEY.

			a.m.
Exeter	154½	..	6.50
Trow Hill	169¾	..	7.36
(Non-stop to top of hill. Sign check sheets.			
Lyme Regis	182¼	..	8.17
Bridport	192¼	..	8.44
Dorchester	207	..	9.28
Blandford	222¾	..	10.15
Salisbury	245½	..	11.21
(Sign check sheets. One hour stop. Luuch at White Hart Hotel.)			
			p.m.
Salisbury	245½	..	12.21
Andover	263	..	1.16
Basingstoke	281½	..	2.12
Blackwater	294½	..	2.51
Staines	310½	..	3.40

Although not so important in point of number of entrants, the Bristol Club's trial to Land's End is probably more strenuous than the London-Exeter. To include such hills as Porlock and Lynton to be climbed in the dark adds an element of uncertainty sufficient to deter even the most hardened riders. The route, too, is longer than the London-Exeter trial, and covers some of the most difficult main roads in England, and, like the M.C.C. event, will prove the efficiency or otherwise of modern lighting systems, for in this trial the competitors have no fewer than fifteen hours' riding in the dark.

TOURING is the most fascinating phase of motor cycling. For its full enjoyment agreeable hotel accommodation is essential. Wherever A.C.U. members tour they are sure to find this in the specially appointed A.C.U. HOTELS. These are regularly inspected by the Union's Consuls and Headquarters Staff, and in visiting them the A.C.U. member may always be sure of efficient service, courteous treatment, and reasonable charges.

Do not tour without the A.C.U. Badge on your machine. It is the passport to the best hotel service and "The Freedom of the Road" everwhere.

Water-cooling.

Owners of water-cooled Scotts, Williamsons, and Humbers take warning! If it is freezing when the Christmas festivities commence, empty your radiators. In the whirl of Sir Roger de Coverley, machines may be forgotten.

An Outdoor Journal.

Out and Away is called by the publishers, Messrs. S. Heath Robinson and J. Birch, Ltd., a "posy of travellers' joy," and the second number of this entertaining journal is such indeed. The whole atmosphere is motorish, and will make appeal to all lovers of the open country.

A Petrol-electric Possibility.

In America there is an electrically-driven light car which weighs less than 10 cwt., and which carries its own charging plant in the form of a small air-cooled engine. If this is possible, then the petrol-electric motor cycle, with infinitely variable ratio between power plant and road wheel, is feasible.

Taxation.

This is the time of year when clubs hold dinners, whist drives, dances, and other social events. The Bath and West of England M.C. is among the clubs which held its annual dinner last week, when the president of the club, the Rev. F. Garfield Waterbury, referred at length to future taxation, and suggested that the club should register a protest against any departure from the present means of taxation, and state that, in its opinion, the best form of taxation was that on petrol at so much per gallon.

Powerful Two-strokes.

What began the other day as a mild discussion on types of engine gradually developed into a furious debate on the advantage and shortcomings of two-strokes. A lover of the type asserted that the two-stroke would eventually oust the four-stroke, even for heavy sidecar work. What do readers think about it?

Eighty-four m.p.g. with Sidecar.

At the commencement of this year we ran a chain-driven Triumph sidecar for over 3,000 miles. 2,123 miles of this total were run on benzole without decarbonising, in fact without using a tool. We kept a very careful account of mileage and fuel used, and the average consumption worked out at 84 m.p.g., exactly the average mileage obtained by H. Finch when he drove the Triumph sidecar for the A.A. 5,000-mile benzole test.

Standard Benzole.

The recent A.A. 5,000 mile benzole test proves that benzole of standard quality is not only a superior fuel to petrol, but has absolutely no bad effects on any part of the engine. The only doubt remaining now is the question of obtaining "standard" benzole—that is to say, the same quality used by the A.A. The motor cyclist's best safeguard is to buy "National" benzole, *i.e.*, fuel conforming to the specification of the National Benzole Association—a body of benzole producers which is pledged to market only fuel of a specification which has been proved to have no deleterious effects upon any of the interior parts of the engine.

The Iver Johnson.

A statement was recently made inferring that only one machine of the above make existed in this country. A correspondent writes and says he knows of two or three Iver Johnsons near Taunton.

Jack Frost.

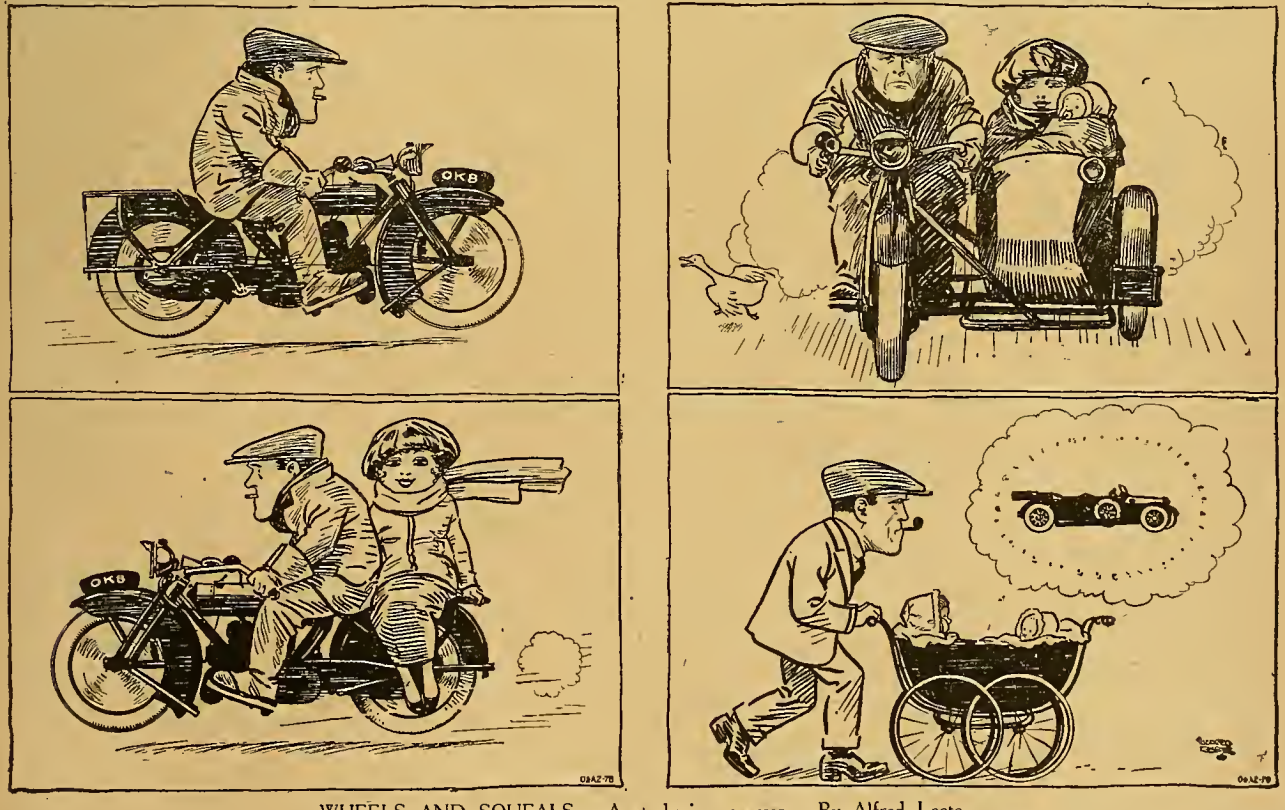
This is the season when the majority of motor cyclists have the advantage of a brother who owns a car. No need for the former to rise hurriedly from the festive board in order to rush to the garage to drain the water from the radiator.

Newcastle and District M.C.

The Newcastle and District Motor Club will call a meeting of motor cyclists early in February, when it is hoped to reorganise the club and enrol many youthful motor cyclists. The fact that the Six Days Trials in 1920 may use Newcastle as the centre is responsible for this special activity.

£200 Prize for a Name.

In connection with the campaign in favour of an Anglo-American standardised metric system, one thousand dollars (£200) is being offered to the person first suggesting the best name word denoting U.S. America and Britannia. The contest is open to all. Words to be considered must be received by the World Trade Club, 681, Market Street, San Francisco, before May 1st, 1920. The amount mentioned will be paid in the currency of the nation from which the best word is suggested to the person first suggesting the best name. "Unitania" is the best word received thus far.



WHEELS AND SQUEALS. A study in progress. By Alfred Leete.

(Reproduced from "Out and Away," published by G. Heath Robinson and J. Birch, Ltd.)

OVERSEAS SECTION.

A Commentary based upon Practical Experience and a Study of Overseas Opinions.

Overseas Models at Olympia. THOSE buyers from abroad who visited the 1919 Olympia must have been impressed by the many machines obviously designed to suit their special requirements. No longer can it be said that the British motor cycle is unsuitable for Overseas, as the majority of new machines appear to lean towards the "Colonial" specification even at the expense of the demands of the rider in the home country. Since the last Show the position has been reversed, and, while five years ago, the Overseas buyer was expected to put up with a machine designed for British roads, the 1920 motor cyclist, in many cases, will be running a motor cycle developed in excess of his requirements. Few will complain on this score, however, as it is recognised that the average motor cyclist's requirements are better met by a machine with large wheels and high ground clearance than by the types in majority in 1913.

♔ ♔ ♔

Wheels and Transmissions. CHAIN drive is now almost universal on heavy machines, and 28in. × 3in. tyres the general rule. Among the many machines so equipped may be mentioned the following: Ariel, A.J.S., Abingdon, B.S.A., New Imperial, Matchless, British Excelsior, Rex, James, Clyno, Sunbeam, Enfield, and Royal Ruby. All of these machines have been designed with a view to meeting the demands of Overseas' buyers so often urged in *The Motor Cycle*.

♔ ♔ ♔

Other Overseas Needs. IT is gratifying for us to note the abundant results of our campaigns in favour of points to place the British motor cycle in a better position to compete in the markets of the greater world. As a result of these efforts, the British industry has been convinced of the need for larger wheels, stronger frames, chain transmission, and, finally, spring frames. While all this may have been appreciated, the average maker appeared loth to embody such points, while the home demand for less ambitious machines absorbed the main part of his output. He now knows, however, that, to meet Overseas requirements, does not necessarily mean the production of an extra model. For 1920 there will be quite a large number of spring frame machines, and, although the majority are in the smaller types of machines, there are many examples of the large twin to show that the proposition has been tackled for both solo and passenger work. Among the solo machines may be mentioned the 3½ Douglas, A.B.C., Royal Ruby, Precision, Paragon, Coulson, and Wooler; in the heavier types the Clyno, Matchless, and Royal Ruby. Between the two types is the Raleigh flat twin, eminently a dual purpose mount, which answers the needs of the Overseas buyer of the medium-powered spring frame machine. As a compromise between the rigid and spring frame, quite a number of manufacturers favour the spring seat-pillar and semi-spring frame. Among the former may be mentioned the A.J.S., B.S.A., Ariel, Chater-Lea, Rex, and the latter people include the Edmund, Bat, and L.M.C., while the Barnes spring saddle as fitted to Zeniths is an important advance.

♔ ♔ ♔

Metal Sidecars. THE need for metal sidecars, too, has been recognised and several makers are now producing sidecar bodies in which the woodwork is reduced to a minimum. Some makers are also so designing the lugs on the motor cycle frame that the sidecar may be fitted on the right side of the machine if required, while attention has also been paid to the fitting of luggage grids sprung with the body.

♔ ♔ ♔

Interchangeable Wheels. QUICKLY detachable and interchangeable wheels are becoming general practice on sidecar machines and several are equipped with a spare wheel, which, incidentally, is a point not yet covered by American machines.

♔ ♔ ♔

Delivery. ON the point of delivery there appears to be evidence at the present time that makers' outputs will not be very good until well on into the New Year. For three months or more the moulders have been on strike, and, even when their differences have been settled, it may be several months before many makers obtain delivery of castings, which are so important in all engineering productions. As we write, it may be said that the whole engineering industry of Great Britain is impatiently waiting for labour to settle down to work again.

HILL-CLIMBING IN ARIZONA

An American competition rider, H. C. Scherer, who established a new record for the Three-flag Course (from the Canadian border to Mexico) on a Harley-Davidson by covering the distance (1,716 miles) in 64 hours and 58 minutes

HUTCHINSON

Model B 37.

Comfortable touring body with bulbous back, opening to give ample room for luggage, etc. Room for petrol tin under seat. Locker of polished mahogany, for maps, etc, in front facing passenger. Standard colour dark green, upholstered in best quality "Rexine" cloth.

Price of above, fitted to A 36 chassis, complete £32 0 0
Suitable for machines up to 5-6 h.p.

EXTRAS:

Fancy colours	£1 1 0
Hood	£4 10 0
Apron	£1 10 0

A Selection of Letters from Readers scattered all over the World.

Trade Abroad.

"INDIA," Allada Valley, Katary, Nilgiris, South India, says: "I do not think motor manufacturers at home know what a bad turn British agents are doing them. Here, in India, one of the most famous English outfits advertised at £140 was sold (with the rupee at 1s. 6d.) at an equivalent of £202 5s. The rupee is now 2s., and the said combination is still being sold at 2,700 (against 2,800 Rs. before), or at present equivalent to £270! American bicycles and sidecars, developing much greater h.p., are sold for much less. It is all very well to say that British machines will always be preferred. I refused an American during the war, and waited for a British machine. I got it, and could get no spares. I have tried for five months, and written home three times. This make of machine used to be the most popular in these parts, but three men whom I have met tell me that they, too, have had the following experiences: One got no answer to his letters for spares. One got spares of the wrong size. The third had to wait many months. A friend of mine at home, whom I asked to tackle the firm, has just written: 'You evidently do not understand that they are full up with orders for a year, and simply do not want to be bothered with such orders.' Well, my machine is now on sale. I have bought a 7-9 h.p. Harley-Davidson and sidecar, and 'you bet' the H.-D. Co. will see their agents have all the spares in stock.

"Of course, it is a very happy position to have orders enough for a year; but, meanwhile, British machines are being driven out of their position of favouritism by the prices British firms allow their middlemen to charge, and the fact that spares are not always forthcoming.

"It is credibly reported here that one or more American firms intend to cancel their agencies, because their middlemen will not sell their motors at a fair profit. This seems to be a point of view the British firms do not worry about; but if the Americans establish direct agencies, as it is reported they are going to do, and sell their machines at about half the cost of those from home, and of at least equal power with the British, British firms will find at the end of one year or so of boom there are twenty American motors and motor bicycles to one British on the market in India."

10,000 Miles in Many Countries.

"M.L.L.," of the Italian Economic Mission to the United States, writes: "The hope that your mail bag is not over full with letters from British motor cyclists touring in the States induces me to send you these experiences of mine, extending for a distance of over 10,000 miles, and on roads in England, Scotland, Ireland, France, and the U.S.A.

"Last March, on demobilisation, I bought a 1919 model, chain-cum-belt 4¼ h.p. B.S.A. motor cycle, which has been my faithful companion ever since, and on which I have spent the greater part of my time on the road.

"From March till July I toured England, Wales, and Scotland, entering into every county in the first two, and taking part in many competitions, including the classical London to Edinburgh run.

"In July I went over to France, and passed a pleasant fortnight on the roads between Boulogne and Paris and Le Havre.

"In August I had a little hill-climbing fever, and visited Wales and North Devon. I found my Waterloo neither on Bwlch-y-Groes nor at Lynmouth. I was then travelling with a light sidecar attached.

"September saw me cross over to Dublin and shake the sidecar to pieces over the bad roads in the sixteen Southern counties I visited. The glorious scenery in County Kerry and the hospitality of the people went a long way to make me forget the roads.

"On the 18th I crossed over to Paris with my faithful B.S.A. and stayed in the gay capital till it was time to get the boat over to America. I rode to Brest and crossed the herring pond. I have now been here in the States about two months. Business has kept me off my machine a great deal, but, nevertheless, I managed to ride to Indianapolis and see the famous people there. I believe mine was the first real British thoroughbred they had seen. They were very pleased with the excellent 'service'—to use an American slang for reliability given by the machine.

"Looking back over these 10,000 miles I see that my troubles have been:

"*(a)* Oil freezing in the drip feed one very cold night when on the 'Hog's Back.'

"*(b)* Three sooted plugs during the first 2,000 miles, owing to too liberal lubrication and use of cheap plugs.

"*(c)* A broken kick-starter spring.

"*(d)* A broken valve lifter Bowden wire.

"*(e)* Two belt pull-throughs.

"*(f)* Punctures, etc., in great abundance. In fact, my only involuntary stoppages were from this cause. The bad conditions of the roads and under inflation were the principal causes of tyre trouble.

"The engine is in excellent condition and ready for 10,000 more miles, as I had occasion to see during the sea journey, when I gave it a general overhaul. The whole arrangement of the machine is excellent, and my only criticisms are:

"*(a)* The present 26×2½in. tyres are insufficient. 650×65 mm. would be much better also, in consideration of the greater ease of replacement when out of England.

"*(b)* The present drip feed is inefficient. A positive feed or an automatic lubrication would be better.

"*(c)* A handle-bar-controlled clutch would render the machine easier to drive in traffic.

"I will not mention such refinements as electric light, etc., on American lines, because I am sure all progressive British makers will include them in their 1920 models.

"I will end by saying that during the first 10,000 miles the consumption was: *(a)* petrol, 114 gallons; *(b)* oil, 11 gallons. I will add the usual disclaimer."

The Rover in France.

L. DELABRE, of Messrs. L. Psalty and Delabre, motor agents, Paris, in forwarding the photograph below, says: "You will probably be interested with the enclosed photograph, which represents the Prince of Monaco, aged

The Prince of Monaco, aged 71 years, taking delivery of a new Rover sidecar in Paris.

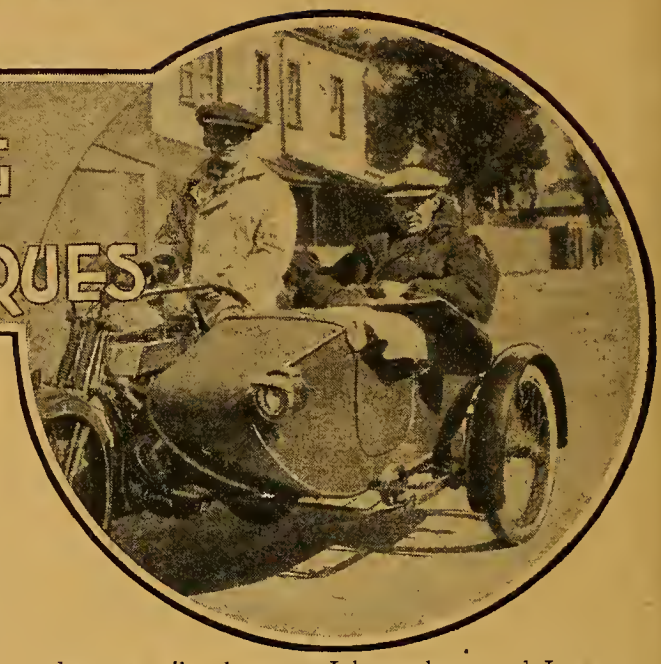
71, taking delivery of a Rover 3½ h.p. and sidecar, to be used on the devastated land in the Département de l'Aisne, which is to be rebuilt under his control.

"If you can spare a little space in your esteemed paper to remind English manufacturers that they are losing a good chance in their leaving the French market without any motor cycles you will oblige."

Direct Representation.

"An Englishman in Canada" writes on the question of direct representation in the Dominion, and refers to the Association of British Accessory Manufacturers, which is opening a stores in Canada. "This is a step in the right direction, but if makers of complete machines would set up depots where spare parts could be obtained, there would be some hope for them securing their share of the trade Overseas."

FROM JOHANNESBURG TO LOURENCO MARQUES



A Journey Through the Native Reserves of Swaziland.

TO the majority of motor cyclists in this country Lourenco-Marques is just a place on the map which was mentioned in English newspapers at the time of the Boer War. It is the chief port of Portuguese East Africa, and, although it is only three hundred odd miles from Johannesburg, one seldom connects the two cities when thinking about either place. Probably this is due to the fact that, between the East coast of Africa and the capital of the Transvaal, lies Swaziland, which, to the average English mind, conjures up visions of big game hunting and unclothed savages.

How often is the actual so different from the imaginary. From the photograph on the right, it will be seen that Swaziland might easily pass for a part of the north-west of Scotland, or even Central Wales; yet until this year the 374 miles between Johannesburg and Lourenco Marques had never been traversed by a motor cycle. The honour of doing the first journey on motor cycle and sidecar belongs to Messrs. Rose and W. S. Thomas, of Johannesburg, who used an 8 h.p. Royal Enfield outfit, and did the journey at an average speed of 18 m.p.h.

Considering the very bad road conditions, 21 hrs. 20 mins. running time was extremely good going, although the frontiersmen appear to have been disappointed that they did not succeed in reaching their destination in two days.

We are advised that Mr. Rose found the road fair all the way to Ermelo. From Ermelo to Lake Chrissie the travellers report the road in a specially

(Left) The drive down Polana Beach at Lourenco Marques.

(Right) Midst the Swaziland Mountains over the Transvaal Mountains at Oshoek From here the road drops 3,000ft. down M'babane, a distance of eight miles.

From Johannesburg to Lourenco Marques.—

bad condition, and from Lake Chrissie to Vlakfontein encountered heavy sand. The travellers reported a fine herd of blesbok about here, but saw no more game during the rest of the trip. Blesbok are about the size of small oxen, and are dangerous at times.

In Portuguese East Africa.

Vlakfontein to M'babane was good going, but hilly. From M'babane to the Portuguese Customs House at Goba (the border of Portuguese East Africa and the Union), the road was in quite good condition. At the Customs House (a small corrugated iron shed) the travellers were given a pass for the motor cycle, which had to be handed in on the return journey. They found the officials quite courteous, but conversation was difficult, as they knew very little English.

From the border there is a new "road" for over twenty miles to Boana. This "road" is very bad, and only consists of two trenches to mark the way across the veldt: a typical South African road.

Messrs. Rose and Thomas stayed a few days in Lourenco Marques, and then started on the return journey to the Rand. Two days were taken on the trip up, with an actual travelling time of under nineteen hours.

Petrol consumption on the outward trip was seven gallons and one gallon oil. Return, nine gallons petrol and one gallon oil. The petrol consumption works out at about 42 m.p.g. for the respective trips.

The following table gives an idea of the distances and times of the trip to Lourenco Marques:

	Miles.	h.	m.
Johannesburg to Springs ...	31	1	1
Springs to Bethal	80	5	45
Bethal to Ermelo	36	2	0

WINTER'S GRIP.

Even when the roads become snow and frost bound they still possess a fascination for lovers of the open, and not the least enjoyable runs are made when the air is keen and the roads bone hard with frost.

WHEN WINTER HOLDS SWAY.

IN our young days, when our only dread lay in the danger of one day acquiring by some mischance a mount which had no speed—which was, in fact, too slow to catch a cold—none of the hazards of winter riding had any terror to shake the soundness of our hearts.

Now that the first flush of enthusiasm has given place to those incipient twinges in the joints that at once warn us of the season of the year and the passing of youth, the most ardent soloist may pause to allow himself furiously to think.

And having thought and pondered on the state of the roads, now awash with rain, now smothered in slime and mud, and anon treacherous with ice and snow, he whose past experience teaches wisdom need feel no shame if, believing discretion to be the better part of valour, he hangs a sidecar on his mount until the sun of spring smiles once again. WHARFEDALE.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

FINDING A WINNER.

Sir,—*Re* finding a winner in reliability trials, there is one method which, to my mind, stands out as a certain solution, and also one which will be materially conducive to progress in every way. This is a fuel efficiency test on a ton mileage basis. The speed at which machines are to be driven to be limited between, say, 15 and 25 miles per hour, the average touring pace. This limit would do away with freak performances, which have no value to the industry. For the welfare of the industry generally—as opposed to competitions being sporting propositions pure and simple, and a test of men rather than of machines—the most economical machine and accessories should, I think, be recognised as the goal at which all makers are aiming, and, in fact, the principal reason why these reliability trials are entered into at all. I take your paper regularly, and follow with interest the various discussions in your Correspondence columns.

Brisbane, Queensland. WILFRID PILKINGTON.

MOTOR SCOOTERS.

Sir,—I have just returned from an excursion around this city (Bristol) on a well-known type of scooter, and, as you are aware, there are some very stiff hills in the town itself, and after an enjoyable morning feel I would like to air my views in opposition to Major Kennedy, though I will first admit that I have not had much experience with scooters. I have always been very interested in them, and certain that they will become very popular with the public, especially with women, provided they are handled properly by those who sell them, and that they can be sold cheaper than at present

Major Kennedy states that a novice has a great deal of difficulty in starting these little machines; the one I am lucky to possess is of British make, and will start from cold in four to six walking paces, *not* running; being new, it is a little stiff, so there is no need for a lady to look undignified by hopping. A friend of mine, with a similar mount, which has done hundreds of miles, beats me easily in starting when cold.

Most novices have the idea of always improving things, which is generally the starting of all troubles. Always "let well alone" is the safest plan. Giving everything plenty of oil is more than half the battle, coupled with cleanliness.

My scooter scales 58 lb., less petrol and oil. The mixture problem is surmounted by a single lever carburetter. I have not as yet found a young lady who gets "fed up" after she has ridden a properly designed mount.

The automatic inlet valve and drip carburetter alluded to are not found on the principal British machines. Has Major Kennedy tried to adjust a magneto of the flywheel type? If not, I can assure him it is a "nice job," especially if it has to be done away from "home."

B. O

I do agree with Major Kennedy that it is Aunt Jane and little Dorothy who will have the say with the ultimate scooter, and this is where the good "service" agent will or should come in. He must advise and help his customers as much as possible, and a carefully written little book should be given with each machine. This would help considerably, and relieve the agent. Someone on the agent's staff should have a good knowledge of the type of machine he sells, as I understand is the case in this city, and, of course, many others. It will not be all profit and sunshine to start with, and the public will have to be educated into the scooter's many really handy uses.

I fail to see how some motor scooters weigh as much as two-stroke motor cycles. My last little Royal Enfield weighed more than three times the scooter, though a splendid mount. HAROLD SOLOMON.

Sir,—I am somewhat at a loss to comprehend in what spirit Major Kennedy's letter (December 4th) was written, whether in solemnity or banter. His expression of grief about the A.C.U. Scooter Trial savours of the latter. I charitably suppose, also, that his claim to "a greater experience of scooters than anyone else in Great Britain" must also be taken in a Pickwickian sense, otherwise one can only lament that so much experience should have produced so little knowledge.

On the other hand, as some readers may take the communication seriously, it is well that one or two of Major Kennedy's dogmatic assertions should be contradicted.

He "assures" us that "those who favour a seat on scooters should abandon the idea right away." Yet I have seen a scooter, with lady seated, go through a forty-mile road competition at fourteen miles per hour, schedule time, inclusive of some toughish test-hills and a watersplash, some very bad roads, and other features included by a club competition committee bent on finding a sporting course. Moreover, this scooter, seat included, made the best performance of the day under absolutely equal conditions (except 14 m.p.h. instead of 20 m.p.h.), against a fairly large field for a club event, inclusive of some of the best competition riders in England

Major Kennedy talks of "10in. wheels," "speedman's wobble on a scooter," while his final comparisons regarding tractive resistance, wind resistance, and weight are inaccurate.

He remarks that "tractive resistance is greater in the scooter, wind resistance at least equal, and weight not much less than in a motor cycle." This reminds me of the old description of the lobster as a "red fish that walks backwards"; a good description, except that the lobster is *not* red, *nor* a fish, *nor* does it walk backwards.

Similarly, the tractive resistance of a scooter is *not* greater, the wind resistance at scooter speed *is* less, and the weight is *much* less. FRANK WHITWORTH.

WHEN the leaves are falling and the autumn mists make the roads sodden and treacherous it's worth a lot to know that you can trust your tyres as you swing round the corner and make for home.

That's were the Dunlop rubber studded motor cycle cover scores as well as in its capacity to give long and faithful service.

Don't the A.C.U. Six Days Trials prove it, with 63.63% of the gold medallists on them?

THE LIGHTING REGULATIONS.

Sir,—"Sivel's" letter in your issue of 4th December is astounding, and makes one wonder whether "Sivel" has ever done any night riding at all. He states: "The onus of avoiding accidents should lie with the overtaking vehicle. It does not matter whether the 'obstacle' is a cyclist, pedestrian, vehicle, child, or *anything else*." Naturally, the onus lies with the overtaking vehicle, but does that preclude the advisability of taking precautions to render the risks of an accident as small as possible? If that is so, according to "Sivel's" reasoning, places where the road is "up," or under repair, should not be marked by lights at night—for this certainly comes under his category of "obstacles."

It is not a far cry from that to doubt whether "Sivel" considers a railing necessary to prevent one falling over a cliff when the road runs along its edge. The onus is on the vehicle, he says, and his head light must save him, or else he must have been going too fast, and it is his own fault!

If a pedestrian, even in daylight, falls down a coal shoot left open and unattended, the court awards him damages. Why? When, according to "Sivel's" reasoning, head lights are for the purpose of showing us what is in front, so that we can avoid it, and, similarly, the pedestrian's eyesight should have enabled him to avoid the accident.

Since my letter, published in your issue of 11th December, was written, I have moved to the country, and now ride two miles home from the station every night, along a road practically destitute of lights, but much frequented by cyclists and motor cars with glaring head lights. During this short period I have become, if possible, even more convinced of the necessity for a rear light for cyclists, both for their safety and for my own, and I cannot conceive any night rider thinking otherwise.

Incidentally, I may mention that many of the local pedestrians, obliged to walk in the road owing to lack of pavement, carry lanterns with them at night—for their own safety from traffic, I am informed. And yet so far I have met no one "road hogging" it at night here!

C. TYERS.

Sir,—From the point of view of a push cyclist, I would like to say that I agree entirely with "Toleration." It is surprising how close one may get to another cyclist minus a rear light without being aware of it, even when oneself has a good head lamp.

In the next letter, "Sivel," referring to the rear lamp, speaks of "its notorious unreliability, both as regards its keeping alight and its value as a preventive of accidents." As far as unreliability is concerned this may be due to two causes—(1) design and (2) treatment.

In the first place, it is up to the purchaser to get a good lamp, and in the second place, to look after it. How many people one sees on the road with oil rear lamps having their wicks turned up too much, air holes and chimney clogged with soot, and the red glasses smoked so much that they are rendered almost invisible?

Such a lamp *is* unreliable both as regards keeping alight and as a means of preventing accidents. If you buy a good lamp and give it a little attention it will not go out, and it will prevent accidents. Surely it is not too much trouble to give an oil lamp a few minutes every week.

Leamington Spa. KNIGHTRIDER.

Sir,—I trust we disputants on the subject of rear lighting are not absorbing more than our fair share of space in your valuable journal, but I am in the lists again in reply to the letters, from Messrs. Holland and Tyers, in your issue of December 11th.

Mr. Holland alleges an absence of logic in my letters, and then proceeds to demonstrate his own absolute lack of that valuable commodity. A misquotation, Mr. Holland, is a misquotation, and no amount of "explanation" will alter the fact. I submit that no one reading my letter in a fair and intelligent manner would contend that I suggested that all such impedimenta as were mentioned should bear a red lamp. Further, in his letter, "Iorwarth," referring to pedestrians, says, "These usually have the sense to get out of the way," the inference being, obviously, that certain other road users have not that sense. I take leave to doubt the statement that cyclists "often" display red lights in front and white lights behind! I ride some hundreds of miles at night during the year and have never seen one yet.

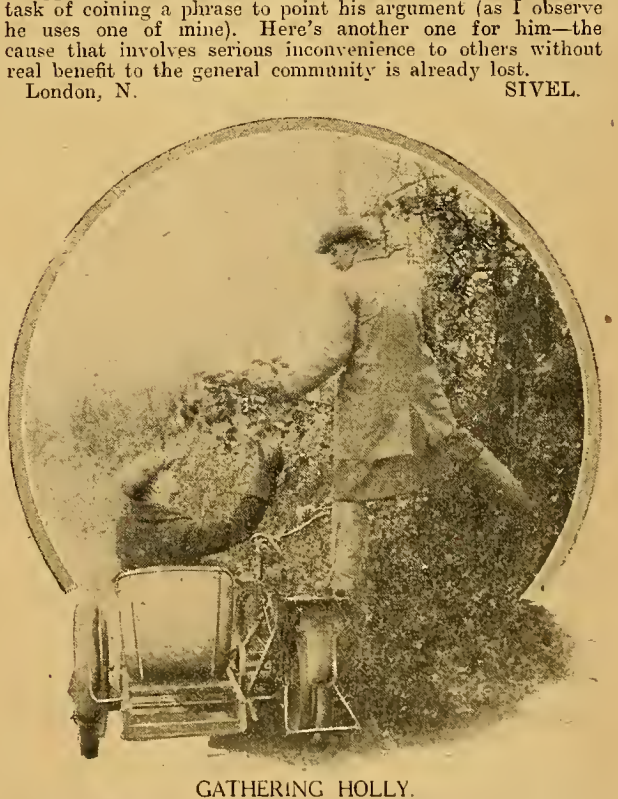
I know that my escapes from being smashed up by passing motorists were not due entirely (mind the split infinitive next time, Mr. Holland) to my rear light, because on one occasion I drove my machine into a grass bank to avoid being run down, and on another had my rear lamp bent forward by some projection on a passing car. Does this flatter the rear light enthusiast? My escape was due in each case solely to such skill as I possess in driving, otherwise I might now have been in a spot whence it would be impossible to give those who need it the benefit of my enlightened views on this subject.

I have been riding bicycles, pedal and motor, for thirty years, and have probably done as much night work as most cyclists, and have never yet run into anything, simply because I ride according to the condition of the road before me as revealed by my lamp. I am as fond of a "bat" at 30 or 40 m.p.h. as most people, but on a clear road in daylight, please, not at night when the best of lamps will not always show up every possible source of trouble. Let me commend to the notice of the red lamp champions the query on page 765 of your issue of December 11th, under the heading of "Cattle on the Road," and the reply, more especially the last three paragraphs of the latter.

Summed up, the argument appears to be: "I can see nothing in front of me, no red lights apparent; ergo, there's nothing there, and I can tear along in the dark at any speed." This is the only logical conclusion from the contentions of the supporters of the lamp, and I should zealously support any movement to do away with it, as I would, also, the effort to suppress that other ridiculous regulation, the "speed limit," made by the amateurs who frame our laws. "Riding to the public danger" if you like, but not this infantile provision! There are plenty of motorists who would undertake to ride down the Strand during the daytime at thirty miles an hour with less danger to the general public than would be involved by other road users travelling at a tenth of that speed.

Apparently Mr. Holland's faculties are not equal to the task of coining a phrase to point his argument (as I observe he uses one of mine). Here's another one for him—the cause that involves serious inconvenience to others without real benefit to the general community is already lost.

London, N. SIVEL.



GATHERING HOLLY.

A few miles run in the country at Christmas time will generally result in a "find" of holly if the passenger keeps a good lookout

THE MUDGUARDING PROBLEM.

Sir,—A few weeks ago I took delivery of a well-known Coventry make of motor cycle, and had some hundred miles to ride to bring it home. It rained and snowed practically the whole of the ride, and, much to my disgust and discomfort, I was simply plastered from head to foot with mud on my arrival.

One reads a lot about mudguarding, and several firms have taken the matter to heart by fitting efficient guards. This particular firm seems to forget the climatic conditions that one has to contend with. The machine itself is *almost* ideal. SOL.

Sir,—As a medical man who has regularly used motor cycles of various makes in his practice since 1901 (I have owned twenty-one and ridden many others), I can state definitely that I *have never had one single machine which was properly mudguarded.* I have had to have special mudguards made for every machine I have owned. The majority of motor cycles are mudguarded on the principle of the push bicycle, which type of mudguarding is quite inefficient when applied to a motor cycle. The best mudguarded machine I have owned was called, I believe, the Midget Bicar. This machine had wide, flat mudguards and was fairly clean. The faults of most motor cycles are :

(1.) Design of frame : Most motor bicycles are merely heavy push bicycles with engine, etc., thrown on.

(2.) Mudguards : After a wet ride mud is deposited in quantities on the back of the rider (particularly on his neck) and on his knees and boots.

(3.) There is not nearly enough clearance between the mudguards and the tyres.

(4.) Too many projections of all sorts on the machine, all of which collect dirt, etc.

(5.) Too many different sizes of nuts, bolts, etc.

(6.) No rear springing, in most cases.

(7.) Often inefficient spring forks (some well-known machines suffer in this matter).

(8.) Too many twiddly bits on handle-bar.

(9.) Exhaust noise and valve clatter generally too pronounced.

(10.) Transmission, etc., on wrong side of machine (this applies more particularly to machines used for sidecar work).

I have used my machines in all types of weather by day and night, so I think I can speak with some authority. At present I am keeping my eye on *The Motor Cycle* with the view to the purchase of a motor after my return from foreign service. It seems, however, that I shall have to go in for a small two-seater (three or four wheels), unless I can find a really clean, dependable machine, with the above stated faults eliminated. M.D., R.A.M.C. (T.F.).

Italian Expeditionary Force.

COMPETITIONS FOR PASSENGER VEHICLES.

Sir,—The present position with regard to trials for passenger vehicles appears to me to be wholly and entirely unsatisfactory, chiefly owing to the recent decision of the authorities that all three-wheelers shall come under the A.C.U., and all four-wheelers under the R.A.C., without any exception or reservation.

The Auto-Cycle Union and the R.A.C. are organised, not merely as independent, but as thoroughly water-tight compartments; each assumes a magnificent unconcern in the proceedings of the other. One therefore assumes that, although three-wheeled cycle cars will compete with sidecar outfits in competition, four-wheelers will be kept strictly to themselves.

One cannot help feeling that this arrangement is likely to confer singularly little benefit either upon the industry or the private motorist of small means.

What seems to me to be quite obviously wanted is a trial, or rather trials, in which all passenger vehicles coming within a certain price limit can run together. We want an answer to the question as to whether it is possible to make a cycle car that is as good as a combination for the same selling price, and we want to know whether or not three wheels are as good as, or better than, four. And that is to instance only two of the points that trials for passenger machines of all types can help to settle for us.

The cheap passenger vehicle is in its infancy, despite the assertions of advertisers, and our problem at the moment is rather the relative efficiency of types than the relative efficiency of individual makes. Hence the present policy of running various types apart instead of together appears to me to be futile. It is of little help to the private individual in search of guidance, or to the designer in need of data.

I would emphasise the importance of classification by price. The man who wants a decent motor vehicle at a low figure does not care two straws whether it is a sidecar, a cycle car, or a light car, provided that it is efficient. Nor does he care much about weight, or about horse-power, except in so far as these factors bear upon the question of price. I would therefore suggest that for the purpose of competition vehicles should be classified simply on a price basis, and the organisation should be in the hands of the R.A.C. and A.C.U. jointly, an arrangement that should be quite feasible, if only for this special purpose.

Wold Newton, Yorkshire. L. FRANCIS JONES.

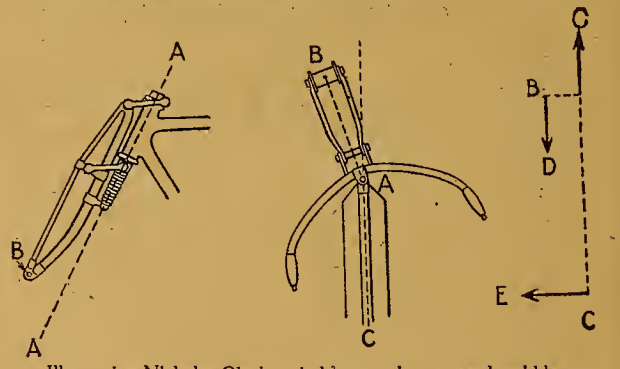
AN INVALID MOTOR CHAIR.

Sir,—When visiting the Motor Cycle Show I saw in the Hammersmith Road an invalid hand-propelled chair with a motor attachment, the maker's name being placed at the back of the seat.

However, this chair was travelling so fast that I was unable to read the address, and as I am particularly interested in this class of machine, I wonder if any of your readers could let me know the maker's name. JAS. COOPER.

SPEED WOBBLE.

Sir,—"Ixion," in *The Motor Cycle* of November 20th, touches upon the phenomenon of "Speed Wobble." I suffered once from this on a 5 h.p. machine, and quite luckily finished my journey in the hedge by the roadside, but the possibility of encountering a hard brick wall next time made me uncomfortable, and I shortly disposed of this machine. Now I see that it is the fault not only of this machine but of others also, and therefore this question becomes very important. As an engineer and air pilot, I know of an explanation of similar phenomenon in some types of aeroplanes, and I will try to explain it in case of a motor cycle. I should be much obliged if "Ixion" would carry out experiments with his machines to examine my idea, and if he would let us know the results. The enclosed sketch and explanation will, I hope, be quite clear.



Illustrating Nicholas Olechnovitch's remarks on speed wobble.

1. *Front Fork.*—A A, axis of turning; B, centre of front wheel.

2. *View from the top* on the machine, with handle-bars turned to the left.

Centre B is out of the vertical plane, and therefore out of line C C of movement of the centre of gravity.

3. *Diagram of forces,* which arise in case of left turning; C C, inertia of the centre of gravity; B D, resistance of the front wheel; C E, side resistance of the back wheel.

Now we can get three different results, depending upon the position of the centre of gravity :

1. If centre of gravity is in the same horizontal plane as the centres of the wheels, machine has a dead balance.

2. If centre of gravity is higher, machine declines out from the centre of circle of turning, and therefore makes a wobble.

3. If centre of gravity is lower, machine possesses an automatic balance.

A good machine can be constructed if the centre of the front wheel B will always remain in the line A A, or if the machine possesses first or third position of the centre of gravity. NICOLAS OLECHNOVITCH, Lieut.

1200 SUCCESSES IN THREE YEARS!

Did you secure at the Show a copy of the ZENITH BUDGET setting out this wonderful record of successes? If not, write to-day for a copy while the edition lasts.

Achieved by riders of the **ZENITH** **in all parts of the world.**

MOTOR CYCLE with the GRADUA GEAR.

THE VERDICT OF THE

Daily Mail

TUESDAY, NOVEMBER 25, 1919.

The motor-cycle of to-day is, above all, the result of individual trial and personal taste. One of the finest, if not the finest, side-cars in the show is the product of a Manchester firm, the Royal Ruby. It is a monument of technical skill combined with a knowledge of what the user wants. Leaf springs rear and front, leaf springs for the side-car, spare-wheel carrier not a mere bolt but part of the side-car chassis, spare petrol tin carrier part of the luggage grid and secured very much after the style of the exhaust manifold of a car, cycle frame and side-car insulated completely from all road shocks—these are but a few of its many utilitarian and technical points.

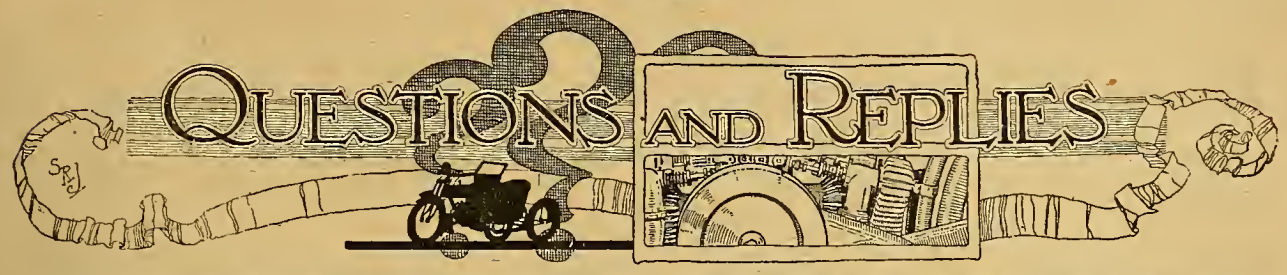
TWO-STROKE.

GIVE THE BEST RESULTS FROM YOUR ENGINE.

The favourite of both expert and novice.
BROWN & BARLOW, Ltd., Witton, BIRMINGHAM

In answering these advertisements it is desirable to mention "The Motor Cycle."



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Mechanical Lubrication.

Does a mechanical oil pump, worked from the timing gear, lessen the efficiency of the whole engine as a power unit to so great an extent that the improved oiling would not warrant its use?—O.B.M.

A mechanical oil pump of dimensions suitable for a motor cycle engine does not absorb sufficient power materially to lessen the general efficiency.

Gear Ratios.

(1.) My 2¾ h.p. two-stroke Connaught has a single speed, belt rim 20in. diameter, and flywheel pulley 4in. diameter. I have fitted a two-speed gear; the number of teeth on clutch pulley of the gear box is thirty-two. The belt pulley on the gear box is 6in. diameter. Will you please state how many teeth I shall require on the flywheel sprocket to bring it to the same speed as it had when single geared? (2.) On the same question, to increase speed do I require a smaller or larger number of teeth on the flywheel sprocket?—W.S.

(1.) You will require a twenty-one tooth engine sprocket. (2.) To raise the gear you will require more teeth on the engine shaft sprocket.

Fitting a Dynamo.

I am desirous of fitting a lighting set to a 6 h.p. military model Clyno. Could you give me any advice as to the best means of getting an easy drive for the dynamo? There is a ½in. nut on the end of the magneto shaft, and I thought to screw a drive on to that projecting outside the chain case. Would you consider that a practical proposition? If so, what size sprocket or pulleys ought I to employ to get the dynamo working fast enough? Specification of dynamo states 800 r.p.m. (cut in speed) to 3,000 r.p.m. It seems impossible to get a drive either from the engine or countershaft.—L.F.H.D.

We do not recommend the driving of the dynamo from the end of the magneto shaft, since the magneto bearings are not designed for any extra load. You would also require to gear up again, owing to the fact that the magneto only runs at half engine speed. Is it not possible to fit an additional pulley on the engine driving sprocket? If you can do this, the diameters of the driving and driven pulleys should be in the ratio of 3 to 2. This gearing will give you the most suitable dynamo speed at normal engine revolutions.

Castor Oil.

(1.) I should be glad if you would advise me on the value of castor oil as a lubricant for the motor cycle cylinder, and how would the cost compare with the oils of usual practice? (2.) Can you say whether the percentage of single-cylinder overhead valve engines on the market is low or reasonably high, and do you consider the engine essentially a "speed merchant" or touring type?—N.T.F.

(1.) As a lubricant for motor cycle engines, a pure castor oil has not proved satisfactory; moreover, it would be extremely expensive. If you are deeply interested in this subject, we would advise you to communicate with C. C. Wakefield and Co., Wakefield House, Cheapside, London, E.C.2. (2.) We should imagine that the percentage of such engines on the road is extremely low, but they are gaining in popularity. Hitherto the overhead valve power unit has been regarded as essentially of the racing type.

An Untrained Horse.

While I was travelling by motor cycle I overtook a horse and trap driven by a farmer. He was in the centre of the road, allowing me plenty of room to pass, but, just as I was about to do so, the horse (a young one) shied, and plunged across the road directly in front of me. I unavoidably ran into the trap, and was thrown headlong into some wood fencing, receiving concussion of the brain. It will be some time before I shall be fit for work, while my motor cycle is badly damaged. How do I stand for compensation?—M.H.S.

The driver of the horse and trap is not necessarily liable for damage done through his horse shying and plunging across the road. You would have to show that there was some negligence on the part of the driver, and it was through his unskilful driving that he did not keep the horse under proper control. This would probably be difficult to prove, and, if you commence an action you ought to have the support of some independent evidence showing exactly how it occurred. Even if the driver of the horse and trap were guilty of negligence, you would not be able to recover damages if you yourself were going too fast. The best plan to follow would be to write to the farmer explaining the injuries sustained, and ask for compensation. However, on the facts, it would probably be better to compromise than to get involved in an action.

Timing a Douglas.

Will you kindly furnish me with particulars of valve and ignition timing for 2¾ h.p. Douglas for fast running, so that with the ignition retarded the timing would become as normally used with ignition almost fully advanced?—C.M.

In timing the Douglas engine, a certain amount of overlap of the valves must occur. When the piston is at the top of the exhaust stroke, the valve should be not quite closed, and the inlet valve should have commenced to open; about 5 to 10 degrees of overlap should be allowed, but we should advise you, if you wish to go into this subject thoroughly, to obtain the instruction book from the makers, as this gives timing diagrams both for standard and overlap cams. The maximum advance of the ignition should not exceed 20 degrees before top dead centre, and this should be with the ignition control in the fully advanced position; timing it in the way you suggest would render starting extremely difficult, and there would be no advantage in running.

Heavy Consumption.

I have a 1919 Villiers two-stroke, which has run about 500 miles. Owing to popping back in carburetter (Amac) I thoroughly cleaned the cylinder, piston, rings and grooves, and made certain of all joints on replacing. It starts very easily, and two-strokes well at all speeds. I set drip-feed, so that the engine smokes very slightly, and use a good single point plug, and it takes nearly full air with 24 jet. It is timed so that spark occurs on top dead centre of stroke with ignition fully retarded, but when fully advanced the spark occurs when piston is only ¼in. from top of stroke. Will you please inform me: (1.) What is the cause of overheating and loss of power on hills? (2.) Only doing 60 m.p.g., when previously it did over 100 m.p.g. with a larger jet? (3.) Is ignition too far retarded?—G.E.F.

(1.) The level in the carburetter may be too high, also the sparking plug may be of unsuitable design. In other respects you appear to have effected all the adjustments correctly. We presume that you have not by any chance replaced the piston wrong way round. (2—3.) A poor consumption points to the fact that the trouble lies in carburation. (4.) The ignition timing is correct, but the advance seems unusually small.

Philipson Pulley.

I shall be glad if you will give me your advice as to the working of the Philipson pulley. The pulley does not seem to expand on hard hill work, but does so if firmly pressed or retarded by the heel of the boot. I bought the pulley to fit a 3½ h.p. Triumph, and as far as I can see the gear has had very little wear. How am I to lubricate the working parts?—J.Y.C.

The Philipson pulley you have appears to be one fitted with a racing spring. This does not work automatically, and requires a good deal of pressure on the periphery of the governor. If you require the pulley to work without control you should write to the makers, who will quote for the conversion of the racing governor to the touring type. Personally, we prefer the former. On the Triumph the pulley is self-lubricating through crank case release in main shaft.

Tyre Sizes.

I shall be obliged if you can give me the following information. I have a Humberette light car, which is at present shod with Dunlop 700×65 mm. tyres, which are a perfect fit, but are apparently unobtainable now. I have tried 650 × 65 Voiturettes, which will not attempt to go on. Will you please tell me how tyre sizes are measured? No one seems to know amongst my acquaintances. I have a small runabout, with 650 × 65 rims, and I wish to get oversize tyres, in order to raise the gear slightly. Are there oversizes for these rims?—J.S.W.

Tyres are measured across the outside diameter, and also by the diameter of the section; thus a 28 × 3 cover is 28in. extreme diameter across the wheel, and 3in. diameter in section. Oversize tyres are made for most rims, thus 26 × 2, 2¼ and 2⅜, also 26 × 2½, for 2¼, all fit the same rim, the larger sizes being oversize. The most suitable oversize covers for your 650 × 65 Voiturette rims are 700 × 80. These will no doubt increase your gear to the extent you desire. The Dunlop Rubber Co., Ltd., Aston Cross, Birmingham, will no doubt supply you with a booklet giving much interesting information on tyre sizes, if you will apply to them.

Fitting Another Engine.

I have a small two-seater cycle car fitted with 5-6 h.p. single-cylinder engine a.o.i.v. Lately, at a sale, I picked up a Riley 8 h.p. water-cooled V type twin engine, in excellent condition. Can I fit this to my car? My difficulties are as follow: (1.) Riley engine has no starting handle; main shaft ending flush with crank case. (2.) My old engine revolved in an anti-clockwise direction; the Riley is clockwise. Can I alter direction of engine revs, or shall I require new gear box? Or again, would it be possible to remove entire rear axle and differential—only the *off side* back wheel of the car is driven—and reverse it, making the *near side* the driving wheel?—H.C.B.

Without having the chassis and engine before us it is almost impossible to give you much assistance. From your description we should imagine that the cost of fitting will be very much greater than you would expect on casual examination. We should strongly advise you to sell the cycle car and engine separately, and invest in a more modern machine. In the matter of reversing the gear box or rear axle, we cannot advise you, as we have no details of the design, and if, for instance, any parts are held by screw lock rings, reversing them might tend to unwind parts which would otherwise be locked up.

Two-stroke Queries

(1.) My machine is a 2¾ h.p. two-stroke: I want to know the best way to time it. (2.) The carburetter is a Senspray. What size jet should I use for most power? (3.) What is the best oil (light or heavy) to use, and what is the best method of oiling a two-stroke, a constant drip or a direct pump full?—NOVICE.

(1.) Time the ignition of your engine as follows: Fully retard the control, and rotate the engine until the piston is at the top dead centre; connect the magneto drive when the contact breaker points are just commencing to separate. (2.) Jet No. 28. (3.) A moderately light oil will suit your engine. A constant drip is more satisfactory than a hand pump for two-stroke lubrication.

RECOMMENDED ROUTES.

CLAPHAM JUNCTION (LONDON) TO HULL.—J.R.Y.

Make your way straight across London, as follows: Clapham Junction, Battersea Bridge Road, Fulham Road, take the third turning on the left, and go straight up Queen's Gate into Hyde Park, make your way straight across from there into Oxford and Cambridge Terrace, cross Edgware Road, and take the second turning on the left (Lisson Grove) just before reaching the Great Central Hotel, then go absolutely straight on into Wellington Road, Finchley Road, Finchley, Barnet, then up the Great North Road through Hatfield, Stevenage, Baldock, Biggleswade, Eaton Socon, Alconbury, Norman Cross, Stamford, Grantham, Lincoln, Brigg, New Holland, by ferry to Hull.

LEICESTER TO LYTHAM (AND TO LAKE DISTRICT).—L.G.B.

Leicester, Melton Mowbray, Grantham, Newark, Retford, Tuxford, Bawtry, Doncaster, Ferrybridge, Aberford, Bramham, Collingham, Harewood, Otley, Ilkley, Skipton, Gargrave, Settle, Clapham, Bentham, Lancaster, Garstang, St. Michael's, Elswick, Singleton, Kirkham, Lytham. The above journey could be done in one day, but would suggest a break at Skipton. Lytham being conveniently near the Lake District, you might make a two days' trip thereto. Lytham, Blackpool, Poulton, Garstang, Lancaster, Carnforth, Burton, Milthorpe, Lindale, Newby Bridge, Greenodd, Coniston, Ambleside, Rydal, Grasmere, Thirlmere, Keswick (break journey here), Troutbeck, Dockray, Ullswater, Patterdale, Kirkstone Pass, Windermere, Bowness, Crook, Kendal, Kirkby-Lonsdale, Ingleton, Settle, etc., back to Leicester.

SPARKLETS

Catalogues Received.

Engineering and Motor Utilities Co., Haslam and Stretton, Ltd., 11, Windsor Place, Cardiff. A well got-up catalogue listing all the principal motor cycle accessories.

Leo Ripault and Co., 1, King's Road, St. Pancras, London, N.W.1. A well got-up catalogue of Ripault sparking plugs of various types, sizes, and reaches. Ripault Oleo plugs are now manufactured in Great Britain. High-tension terminals, plug testers, and compression taps are also listed.

A booklet describing the system of making reinforced concrete roads, compiled by the British Reinforced Concrete Engineering Co., Ltd., 1, Dickinson Street, Manchester, which gives some interesting information as to the construction of these roads, and some informative photographs showing the state of the various roads before and after treatment.

The Leatheries, Ltd., Sampson Road North, Birmingham. An attractive list of leather goods of interest to the motor cyclist. The Empire de Luxe saddles are illustrated; also an excellent range of toolbags, suit cases, and an expanding valise to fit the standard carrier. Incidentally the price of the latter shows some variation from that given in our report of the article when it was exhibited at Olympia, and readers who are interested are advised to write for full particulars to the above address.

The 1920 Levis Tank.

It is perhaps interesting to note that, though the colour scheme of the 1920 Levis tank apparently consists of black panels upon a grey background, it is not really the case. The matter received very careful attention, and it was decided that the tank should receive first of all a substantial coat of hard-wearing black, the grey borders afterwards being applied, leaving the black panels. This, therefore, gives an extra coat on the edges, where the wear takes place.

Engine Lubrication.

We have lately been making a test, with very satisfactory results, of Nulsec Oil, which is made by Mr. W. Blackwell, Victoria Oil Works, Aston, Birmingham. We have used nearly half a gallon in a small four-stroke twin engine having mechanical lubrication, and have covered upwards of 1,500 miles. An oil consumption of well over 3,000 m.p.g. must be accounted excellent on a motor cycle, and we never found that the engine lacked oil at any time during this test. No special effort was made to effect economy, and the results certainly point to the fact that Nulsec Oil is able to resist heat to an unusual degree, otherwise it would have been used up more quickly. The oil is manufactured in a variety of grades.

To You and Yours!

WE devote our page this Christmas week not to call attention to our stock of new models nor to announce our policy for the New Year—the former you can see whenever you are passing, the latter will be the same as in the past ten years—but to simply, honestly, and sincerely wish all our numerous friends

A Merry Christmas & a Happy and Prosperous New Year.

To our customers (whom we are pleased to know are our friends) we desire to say how much we appreciate their support in the past, and to thank those who have done so much by their recommendations to extend our business.

The year which is drawing to a close has been a difficult and trying one for the motor trade. But it has shown us that Agents who play the game can always rely on every consideration and encouragement from their customers.

That you may have a good time this Christmas, and that the New Year may bring you all you desire, with Health and Strength to pursue the greatest of all pastimes, is the Christmas wish of

'Phone: 7091 Mayfair (2 lines).

GODFREY'S LTD.,

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 2/-, and 2d. for every additional word. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed & Co. Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.4), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box ooo, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. ooo, c/o "Motor Cycle," 20, Tudor Street, E.C.4. *Replies to Box Number advertisements containing remittances should be sent by registered post, but in all such cases it is advisable to make use of the Deposit System.*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

THE DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, 1 %. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

A.B.C.

A.B.C.—Option on A.B.C. motor cycle £10; £5 deposit paid 15th April.—57, Talbot Rd., Blackpool. [X1419

Huile de Luxe

(Call it WHEEL OE LOOX.)

If you have a sidecar machine,

consider the economy of buying a 5-gallon drum of oil for your season's requirements—the saving is considerable.

We have ready an interesting, illustrated leaflet showing how you can pour oil from a drum without spilling a drop. Write for this also.

The current Lists give the prices of Oils in drums. Please mention this paper.

Liverpool Reliance Cup Open Trial Successes on

AVON TYRES

Bonus Marks Secured.

The following awards were obtained by successful competitors using Avon Tyres in the Liverpool Reliance Cup Open Trial:

Mead Martin Challenge Cup	Mr. O. Wade.
Gold Medals	Messrs. O. Wade, W. H. Brown, Eric Williams, W. B. Gibb, and T. B. G. Vale.
Silver Medal	Mr. H. Poole.
Bronze Medals	Messrs. R. H. W. Brown and R. Arnold.

Mr. O. WADE, one of the only three competitors in the Trial to gain maximum marks, winner of the Mead Martin Challenge Cup, Gold Medal, and one of the A.J.S. Team, who secured the Silver Cup, writes:

"You will, no doubt, be pleased to hear that I was successful in gaining a Gold Medal in the Liverpool Reliance Cup Open Trial. Your tyres behaved splendidly, and as usual I had no trouble. On Llangollen Canal Hill, bonus marks were given for a clean ascent owing to the very treacherous and greasy surface, and my Avons secured these bonus marks for me."

Mr. E. WILLIAMS, Gold Medallist:

"The lanes they took us through could not have been in a worse condition after the heavy rains on the previous day, but the excellent Avon Non-skids gave me such confidence that I had not a moment's anxiety."

The AVON INDIA RUBBER CO., LTD., 19, Newman St., Oxford St., London, W.1.
